

CONTENTS

PART I - *Fundamental equations of the mechanics of an elastic body.* 1

CHAPTER 1. ANALYSIS OF STRESS.

§ 1.	Body forces	5
§ 2.	Stress.	6
§ 3.	Components of stress. Dependence of stress on the orientation of the plane	7
§ 4.	Equations, relating components of stress	10
§ 5.	Transformation of coordinates. Invariant quadratic form. Stress tensor.	14
§ 6.	Stress surface. Principal stresses.	17
§ 7.	Determination of principal stresses and axes	22
§ 8.	Plane stress	23

CHAPTER 2. ANALYSIS OF STRAIN.

§ 9.	General remarks	28
§ 10.	Affine transformation	29
§ 11.	Infinitesimal affine transformation.	31
§ 12.	Decomposition of infinitesimal transformations into pure deformation and rigid body motion.	32
§ 13.	The invariant quadratic form, connected with deformation. The strain surface, principal axes. Transformation of coordinates	38
§ 14.	General deformation	41
§ 15.	Determination of displacements from components of strain. Saint-Venant's condition of compatibility	44

CHAPTER 3. THE FUNDAMENTAL LAW OF THE THEORY OF ELASTICITY; THE BASIC EQUATIONS.

§ 16.	The fundamental law of the theory of elasticity (generalized Hooke's Law)	52
§ 17.	Isotropic bodies	56

§ 18.	The basic equations for the statics of an elastic isotropic body	60
§ 19.	The simplest cases of elastic equilibrium. The basic elastic constants	62
§ 20.	The fundamental boundary value problems of static elasticity. Uniqueness of solution	66
§ 21.	Basic equations in terms of displacement components	73
§ 22.	Equations in terms of stresses	74
§ 23.	Remarks on the effective solution of the fundamental problems. Saint-Venant's principle.	77
§ 24.	Dynamic equations. The fundamental problems of the dynamics of an elastic body	78
PART II - <i>General formulae of the plane theory of elasticity</i>		85
CHAPTER 4. BASIC EQUATIONS OF THE PLANE THEORY OF ELASTICITY.		
§ 25.	Plane strain.	89
§ 26.	Deformation of a thin plate under forces acting in its plane	92
§ 27.	Basic equations of the plane theory of elasticity	96
§ 28.	Reduction to the case of absence of body forces	101
CHAPTER 5. STRESS FUNCTION. COMPLEX REPRESENTATION OF THE GENERAL SOLUTION OF THE EQUATIONS OF THE PLANE THEORY OF ELASTICITY.		
§ 29.	Stress function	105
§ 30.	Determination of displacements from the stress function	107
§ 31.	Complex representation of biharmonic functions	110
§ 32.	Complex representation of displacements and stresses	113
§ 33.	The physical meaning of the function f . Expressions for the resultant force and moment	116
§ 34.	Arbitrariness in the definition of the introduced functions	118
§ 35.	General formulae for finite multiply connected regions	121
§ 36.	Case of infinite regions.	126
§ 37.	Some properties following from the analytic character of the solution. On analytic continuation across a given contour	131
§ 38.	Transformation of rectilinear coordinates.	137

§ 39. Polar coordinates	140
§ 40. The fundamental boundary value problems. Uniqueness of Solution	141
§ 41. Reduction of the fundamental problems to problems of complex function theory	147
§ 41a Supplementary remarks	156
§ 42. Concept of the regular solution. Uniqueness of a regular solution	158
§ 43. On concentrated forces, applied to the boundary . . .	162
§ 44. Dependence of the state of stress on the elastic constants	164
CHAPTER 6. MULTI-VALUED DISPLACEMENTS. THERMAL STRESSES.	
§ 45. Multi-valued displacements. Dislocations	167
§ 46. Thermal stresses	170
CHAPTER 7. TRANSFORMATION OF THE BASIC FORMULAE FOR CONFORMAL MAPPING.	
§ 47. Conformal transformation.	176
§ 48. Simple examples of conformal mapping.	
1°. Bilinear function	180
2°. Pascal's limaçon.	185
3°. Epitrochoids	186
4°. Hypotrochoids	187
5°. Elliptic rings.	188
§ 49. Curvilinear coordinates, connected with conformal transformations into circular regions.	190
§ 50. Transformation of the formulae of the plane theory of elasticity	192
§ 51. Boundary conditions in the image regions	194
PART III - <i>Solution of several problems of the plane theory of elasticity by means of power series</i>	
CHAPTER 8. ON FOURIER SERIES.	
§ 52. On Fourier series in complex form	199
§ 53. On the convergence of Fourier series	202
CHAPTER 9. SOLUTION FOR REGIONS, BOUNDED BY A CIRCLE.	
§ 54. Solution of the first fundamental problem for the circle	204

§ 55.	Solution of the second fundamental problem for the circle	207
§ 56.	Solution of the first fundamental problem for the infinite plane with a circular hole.	208
§ 56a.	Examples.	
1°.	Uni-directional tension of a plate, weakened by a circular hole	211
2°.	Bi-axial tension	214
3°.	Uniform normal pressure applied to the edge of a circular hole	214
4°.	A concentrated force, applied at a point of the infinite plane.	215
5°.	Concentrated couple	216
§ 57.	On the general problem of concentrated forces . . .	217
§ 58.	Some cases of equilibrium of infinite plates, containing circular discs of different material.	221
1°.	Infinite plate with a circular hole into which an elastic circular disc with an originally larger radius has been inserted.	222
2°.	Stretching of plates with inserted or attached rigid discs	224
3°.	Stretching of plates with inserted or attached elastic discs	226

CHAPTER 10. THE CIRCULAR RING.

§ 59.	Solution of the first fundamental problem for the circular ring.	230
§ 59a.	Examples.	
1°.	Tube subject to uniform external and internal pressures.	235
2°.	Stress distribution in a ring, rotating about its centre	236
§ 60.	Multi-valued displacements in the case of a circular ring	237
§ 61.	Supplement. Bending of a curved beam	242
§ 62.	Thermal stresses in a hollow circular cylinder	246

CHAPTER 11. APPLICATION OF CONFORMAL MAPPING.

§ 63. Case of simply connected regions	250
§ 64. Example of application of mapping on to a circular ring. Solution of the fundamental problems for a continuous ellipse	257

PART IV - *On Cauchy integrals* 265

CHAPTER 12. FUNDAMENTAL PROPERTIES OF CAUCHY INTEGRALS.

§ 65. Notation and terminology	267
§ 66. Cauchy integrals.	270
§ 67. Values of Cauchy integrals on the path of integration. Principal value	271
§ 68. Boundary values of Cauchy integrals. The Plemelj formulae	276
§ 69. The derivatives of Cauchy integrals	279
§ 70. Some elementary formulae, facilitating the calculation of Cauchy integrals	281
§ 71. On Cauchy integrals, taken along infinite straight lines	286
§ 72. On Cauchy integrals, taken along infinite straight lines (continued)	296

CHAPTER 13. BOUNDARY VALUES OF HOLOMORPHIC FUNCTIONS.

§ 73. Some general propositions	298
§ 74. Generalization	301
§ 75. Harnack's theorem.	301
§ 76. Some special formulae for the circle and the half-plane	303
§ 77. Simple applications: solutions of the fundamental problems of potential theory for a circle and half-plane	308

PART V - *Application of Cauchy integrals to the solution of boundary
problems of plane elasticity* 315CHAPTER 14. GENERAL SOLUTION OF THE FUNDAMENTAL PRO-
BLEMS FOR REGIONS BOUNDED BY ONE CONTOUR.

§ 78. Reduction of the fundamental problems to functional equations	317
§ 79. Reduction to Fredholm equations. Existence theorems	323
§ 79a. On some other applications of the preceding integral equations	333

CHAPTER 15. SOLUTION OF THE FUNDAMENTAL PROBLEMS FOR REGIONS MAPPED ON TO A CIRCLE BY RATIONAL FUNCTIONS. EXTENSION TO APPROXIMATE SOLUTION FOR REGIONS OF GENERAL SHAPE.	
§ 80. Solution of the first fundamental problem for the circle	334
§ 80a. Examples.	
1°. Circular disc under concentrated forces, applied to its boundary	338
2°. Disc under concentrated forces and couples acting at internal points.	342
3°. Rotating disc with attached discrete masses . . .	345
§ 81. Solution of the second fundamental problem for the circle	346
§ 82. Solution of the first fundamental problem for the infinite plane with an elliptic hole	347
§ 82a. Examples.	
1°. Stretching of a plate with an elliptic hole . . .	351
2°. Elliptic hole the edge of which is subject to uniform pressure	353
3°. Elliptic hole the edge of which is subject to uniform tangential stress T	354
4°. Elliptic hole (or straight cut) part of the edge of which is subject to uniform pressure	354
5°. Approximate solution of the problem of bending of a strip (beam) with an elliptic hole	358
§ 83. Solution of the second fundamental problem for the infinite plane with an elliptic hole	361
§ 83a. Examples.	
1°. Uni-directional tension of an infinite plate with a rigid elliptic centre	363
2°. Case when the elliptic centre is not allowed to rotate	365
3°. Case when a couple with given moment acts on the elliptic kernel	366
4°. Case when a force acts on the centre of the elliptic kernel	366
§ 84. General solution of the fundamental problems for regions, mapped on to the circle by the help of polynomials	366

§ 85. Generalization to the case of transformations by means of rational functions	374
§ 85. Solution of the second fundamental problem. On the solution of the mixed fundamental problem	379
§ 87. Other methods of solution of the fundamental problems	379
§ 87a. Example. Solution of the first fundamental problem for an infinite plane with a circular hole	380
§ 88. Further examples. Application to some other boundary problems	384
§ 89. Application to the approximate solution of the general case	385
 CHAPTER 16. SOLUTION OF THE FUNDAMENTAL PROBLEMS FOR THE HALF-PLANE AND FOR SEMI-INFINITE REGIONS.	
§ 90. General formulae and propositions for the half-plane	391
§ 91. The general formulae for semi-infinite regions	397
§ 92. Basic formulae, connected with conformal transformation on to the half-plane	399
§ 93. Solution of the first fundamental problem for the half-plane	402
§ 93a. Example	406
§ 94. Solution of the second fundamental problem	409
§ 95. Solution of the fundamental problems for regions, mapped on to the half-plane by means of rational functions. Case of a parabolic contour	411
 CHAPTER 17. SOME GENERAL METHODS OF SOLUTION OF BOUNDARY VALUE PROBLEMS. GENERALIZATIONS.	
§ 96. On the integral equations of S. G. Mikhlin	414
§ 97. On a general method of solution of problems for multiply connected regions	416
§ 98. The integral equations, proposed by the Author	417
§ 99. Application to contours with corners	427
§ 100. On the numerical solution of the integral equations of the plane theory of elasticity	427
§ 101. The integral equations of D. I. Sherman-G. Lauricella	427
§ 102. Solution of the first and second fundamental problems by the method of D. I. Sherman	431

§ 103. On the solution of the mixed fundamental problem and of certain other boundary problems by means of D. I. Sherman's method	440
§ 104. Generalization to anisotropic bodies	441
§ 105. On other applications of the general representation of solutions	441

PART VI - <i>Solution of the boundary of the plane theory of elasticity by reduction to the problem of linear relationship</i>	445
--	-----

CHAPTER 18. THE PROBLEM OF LINEAR RELATIONSHIP.

§ 106. Sectionally holomorphic functions	447
§ 107. The problem of linear relationship (the Hilbert problem)	448
§ 108. Determination of a sectionally holomorphic function for a given discontinuity	449
§ 109. Application	452
§ 109a. Example	455
§ 110. Solution of the problem: $F^+ = gF^- + f$	456
§ 111. Case of discontinuous coefficients	468

CHAPTER 19. SOLUTION OF THE FUNDAMENTAL PROBLEMS FOR THE HALF-PLANE AND FOR THE PLANE WITH STRAIGHT CUTS.

§ 112. Transformation of the general formulae for the half-plane	471
§ 113. Solution of the first and second fundamental problems for the half-plane	476
§ 114. Solution of the mixed fundamental problem	478
§ 114a. Examples.	
1°. Stamp with straight horizontal base	486
2°. Stamp with straight inclined base	488
3°. Effect of asymmetrically distributed forces	492
§ 115. The problem of pressure of rigid stamps in the absence of friction	492
§ 116. Application	496
§ 116a. Examples.	
1°. Stamp with straight horizontal base	501
2°. Stamp with straight inclined base	501
3°. Stamp with curved base	502

§ 117.	Equilibrium of a rigid stamp on the boundary of an elastic half-plane in the presence of friction	504
§ 117a.	Examples.	
	1°. Stamp with straight horizontal base	508
	2°. Stamp with straight inclined base	509
§ 118.	An alternative method for the solution of the boundary problems for the half-plane	510
§ 119.	Problem of contact of two elastic bodies (generalized plane problem of Hertz)	510
§ 120.	Boundary problems for the plane with straight cuts	515

CHAPTER 20. SOLUTION OF BOUNDARY PROBLEMS FOR REGIONS, BOUNDED BY CIRCLES, AND FOR THE INFINITE PLANE, CUT ALONG CIRCULAR ARCS.

§ 121.	Transformation of the general formulae for regions, bounded by a circle	525
§ 122.	Solution of the first and second fundamental problems for the region, bounded by a circle	529
§ 123.	The mixed fundamental problem for a region, bounded by a circle	531
§ 123a.	Example	536
§ 124.	Boundary problems for the plane, cut along circular arcs	538
§ 124a.	Example. Extension of the plane, cut along a circular arc	542

CHAPTER 21. SOLUTION OF THE BOUNDARY PROBLEMS FOR REGIONS, MAPPED ON TO THE CIRCLE BY RATIONAL FUNCTIONS.

§ 125.	Transformation of the general formulae	546
§ 126.	Solution of the first and second fundamental problems	552
§ 127.	Solution of the mixed fundamental problem	554
§ 127a.	Example. Solution of the mixed fundamental problem for the plane with an elliptic hole	558
§ 128.	The problem of contact with a rigid stamp	560
§ 128a.	Examples.	
	1°. Circular disc.	568
	2°. Infinite plane with a circular hole	571
	3°. Infinite plane with an elliptic hole.	574

PART VII - <i>Extension, torsion and bending of homogeneous and compound bars</i>	579
---	-----

CHAPTER 22. TORSION AND BENDING OF HOMOGENEOUS BARS
(PROBLEM OF SAINT-VENANT).

§ 129. Statement of the problem.	583
§ 130. Certain formulae.	586
§ 131. General solution of the torsion problem	587
§ 132. Complex torsion function. Stress functions	594
§ 133. On the solution of the torsion problem for certain parti- cular cases	597
§ 134. Application of conformal mapping.	599
§ 134a. Examples.	
1°. Epitrochoidal section	602
2°. Booth's lemniscate	604
3°. The loop of Bernoulli's lemniscate	605
4°. Confocal ellipses. Eccentric circles	607
§ 135. Extension by longitudinal forces	607
§ 136. Bending by couples, applied to the ends	608
§ 137. Bending by transverse forces	612
§ 138. On the solution of problems of bending for different cross-sections	618
§ 138a. Example. Bending of a circular cylinder or tube . . .	619

CHAPTER 23. TORSION OF BARS CONSISTING OF DIFFERENT
MATERIALS.

§ 139. General formulae	621
§ 140. Solution by means of integral equations	626
§ 140a. Applications..	
1°. Torsion of a circular cylinder, reinforced by a longitudinal round bar of a different material . . .	630
2°. Torsion of a rectangular bar, consisting of two different rectangular parts.	635

CHAPTER 24. EXTENSION AND BENDING OF BARS, CONSISTING OF
DIFFERENT MATERIALS WITH UNIFORM POISSON'S RATIO.

§ 141. Notation	640
§ 142. Extension	642
§ 143. Bending by a couple.	642
§ 144. Bending by a transverse force	643

§ 144a. Example. Bending of a compound circular tube by a transverse force, applied to one of its ends.	647
CHAPTER 25. EXTENSION AND BENDING FOR DIFFERENT POISSON'S RATIOS.	
§ 145. An auxiliary problem of plane deformation	650
§ 146. The problem of extension and of bending by a couple	652
§ 147. Particular cases.	
1°. Extension of a bar, having an axis of symmetry	662
2°. Bar with plane of symmetry, bent by a couple	663
§ 148. Principal axis of extension and principal planes of bending.	664
§ 149. Application of complex representation. Examples	670
§ 150. Problem of bending by a transverse force	675
APPENDIX 1. On the concept of a tensor	682
APPENDIX 2. On the determination of functions from their perfect differentials in multiply connected regions	697
APPENDIX 3. Determination of a function of a complex variable from its real part. Indefinite integrals of holomorphic functions	708
