

CONTENTS

PART 1	DIFFERENTIAL EQUATIONS IN THE SOCIAL AND MANAGERIAL SCIENCES	1
Chapter 1	First-Order Equations	3
	Sales and advertising: the first-order equation, 3	
	Fundamental theory, 5	
	The illiteracy–literacy transition: linear equations, 8	
	The spread of a rumor: separable equations, 14	
	Price speculation: geometric analysis, 17	
	Further applications of first-order equations, 28	
	Exercises, 34	
Chapter 2	Second-Order Linear Equations	40
	Price trends: the second-order linear equation, 40	
	Fundamental theory, 44	
	Phillips’ multiplier–accelerator effect: nonhomogeneous equations with constant coefficients, 50	
	A further application of second-order linear equations, 64	
	Exercises, 67	
Chapter 3	First-Order Linear Systems	73
	The marriage model: the first-order linear system, 73	
	Fundamental theory, 75	
	Voting distribution: linear homogeneous systems with constant coefficients, 81	
	A further application of first-order systems, 97	
	Exercises, 98	

PART 2	CONVEX ANALYSIS IN THE SOCIAL AND MANAGERIAL SCIENCES	109
Chapter 4	Preliminaries	111
	Introduction, 111	
	Convex sets, 111	
	Exercises, 120	
Chapter 5	Convex Structures	123
	A linear production model, 123	
	The technology set: a convex cone, 126	
	Isoquants: convex hulls, 132	
	The factor space: a convex polytope, 136	
	Cost minimization: supporting hyperplanes, 141	
	Exercises, 147	
Chapter 6	Convex and Concave Functions	150
	Cost functions: the convexity assumption, 150	
	An economic lot size problem: minimizing convex cost functions, 162	
	A model of psychoeconomics: maximizing concave utility functions, 167	
	Production functions with budget constraints: Lagrange multipliers, 173	
	Additional properties of convex functions, 183	
	Exercises, 190	
PART 3	CONVEX AND GEOMETRIC PROGRAMMING IN MANAGEMENT SCIENCE	203
Chapter 7	Convex Programming	205
	Introduction, 205	
	A replacement problem: the convex programming problem, 206	
	Competitive interactions: duality in convex programming, 225	

A production scheduling problem: duality in linear programming, 232
 Formulating optimization problems of management science as convex programming problems, 241
 Exercises, 245

Chapter 8 Geometric Programming 254

Introduction, 254
 Preliminaries: the arithmetic–geometric mean inequality, 255
 A queuing problem: the unconstrained geometric programming problem, 258
 A personnel selection problem: the constrained geometric programming problem, 271
 Exercises, 289

Chapter 9 Extensions Of Geometric Programming 309

A marketing mix problem: transforming optimization problems into geometric programming problems, 309
 A personnel assignment problem: exponential programming, 325
 An inventory control problem: the condensation procedure, 334
 Sales force decisions: approximation techniques, 347
 Formulating optimization problems of management science as geometric programming problems, 359
 Exercises, 365

Chapter 10 Reversed Geometric Programming 385

A catalog planning problem: the reversed geometric programming problem, 385
 Inventory control with shortages: the signomial geometric programming problem, 397
 Exercises, 407

Appendix Topics in Calculus 413

Introduction, 413
 Algebra and geometry of vectors in \mathbb{R}^n , 413

Topological notions on \mathbb{R}^n , 420
Differential calculus of functions of several
variables, 424
Exercises, 443
