PREFACE	v
1. BASIC PRINCIPLES AND RECTILINEAR MOTION	1
Basic kinematics. Newton's laws of motions. Further definitions. Energy conservation for rectilinear motion. Worked examples for rectilinear motion of a particle. Systems of particles and variable-mass problems. Exercises.	
2. NON-RECTILINEAR MOTION	22
Introduction. Motion under gravity. Circular motion and elliptic harmonic motion. Motion in electric and magnetic fields. Components of acceleration and velocity in polar coordinates. Exercises.	
3. THEORY OF CENTRAL ORBITS	41
Basic theory. The inverse square law. The inverse square law of repulsion. Two-body problems. Other laws of force. Exercises.	
4. ROTATING FRAMES OF REFERENCE AND KINEMATICS OF RIGID-BODY MOTION	54
Introduction. Motion of reference frames and rigid bodies with one point fixed. Kinematics of rigid body motion. Equations of motion in rotating frames of reference. Motion relative to a rotating earth. Free motion relative to the earth. The Foucault pendulum. Exercises.	
5. KINETIC ENERGY, ANGULAR MOMENTUM, AND MOMENTS OF INERTIA	72
Introduction. Calculation of kinetic energy and angular momentum of a rigid body. Determination of centres of mass and of moments of inertia. Three-dimensional mass distributions. Energy conservation and work. Appendix: the general form of infinitesimal displacement of a body. Exercises.	

6. RIGID-BODY MOTION	100
Derivation of basic equations. Equivalent force systems. Two-dimensional rigid-body motion. Solution of problems in plane rigid-body motion. Examples involving three-dimensional motion of a sphere. Some examples of three-dimensional motions. Exercises.	
7. LAGRANGE'S EQUATIONS	129
Introduction. Generalized coordinates and forces. Derivation of Lagrange's equations. Application of Lagrange's equations to the solution of particular problems. Equations of motion of a plane rigid body. Exercises.
