Foreword by Robert Aumann	xi
Acknowledgments	xv
1 The Need for a New Solution Concept	1
1.1 Our Solution Concept	1
1.2 Cooperative and Noncooperative Games	1
1.3 Irrevocable Commitments within a Noncooperative Game	4
1.4 Limitations of the Classical Theory of Cooperative Games	7
1.5 Games with Incomplete Information	9
1.6 Difficulties with the Concept of Equilibrium Points	12
1.7 The Equilibrium Selection Problem	13
1.8 The Instability Problem: A New Justification for Use of Mixed-Strategy Equilibrium Points	14
1.9 The Imperfectness Problem	16
1.10 Imperfect Equilibrium Points, Subjunctive Conditionals, and Self-commitment Moves	18
1.11 Analysis of Cooperative Games by Means of Non-cooperative Bargaining Models	21
1.12 The Modeling of Bargaining Moves	23
1.13 The Problem of Anticonflicts	24
1.14 Appendix A	26
1.15 Appendix B	27
2 Games in Standard Form	29
2.1 Introduction	29
2.2 Reasons for the Exclusion of Imperfect Recall	30
2.3 Games in Standard Form	31
2.4 Standard Forms with Perfect Recall	41
2.5 Properties of Standard Forms with Perfect Recall	45
2.6 Substructures	49
2.7 Decentralization Properties of Interior Substructures of Standard Forms with Perfect Recall	54
2.8 Uniformly Perturbed Games	60

2.9	Uniform Perfectness	63
2.10	Solution Functions and Limit Solution Functions	64
3	Consequences of Desirable Properties	67
3.1	Introduction	67
3.2	Continuity	68
3.3	Positive Linear Payoff Transformations	70
3.4	Symmetry	70
3.5	Best-Reply Structure	75
3.6	Payoff Dominance	80
3.7	The Intuitive Notion of Risk Dominance	82
3.8	Payoff Monotonicity	84
3.9	Axiomatic Characterization of Risk Dominance between Strong Equilibrium Points in 2×2 Games	86
3.10	Cells	90
3.11	Cell Consistency and Truncation Consistency	100
3.12	Sequential Agent Splitting	109
3.13	Decomposition and Reduction	117
4	The Tracing Procedure	131
	INTRODUCTION	131
4.1	A Bayesian Approach	131
4.2	Strategies	131
4.3	Payoff Vectors	133
4.4	The Phrase “Almost All”	133
4.5	Best Replies and Equilibrium Points	134
4.6	Vector Best Replies	137
	DEFINITION OF THE TRACING PROCEDURE	137
4.7	The Prior Probability Distributions (Prior Strategies)	137
4.8	The Prediction Problem	139
4.9	The “Naive” Bayesian Approach	139
4.10	The Linear Tracing Procedure	141
4.11	Three Numerical Examples for the Linear Tracing Procedure	145

4.12	Decision and Game-Theoretic Interpretation: The Outcome-Selection Process	162
4.13	The Logarithmic Tracing Procedure	165
4.14	The Tracing Map for a Simple Class of Games	175
4.15	The Tracing Procedure in Behavior Strategies	178
	COMPUTATIONALLY USEFUL FACTS ABOUT THE TRACING PROCEDURE	181
4.16	Classification of the Line Segments of Linear Tracing Graphs	181
4.17	Some Useful Lemmas	182
4.18	Destabilization Points	185
4.19	An Example for a Backward-Moving Variable Segment	187
5	The Solution Concept	195
5.1	Introduction	195
5.2	Initial Candidates	198
5.3	Risk Dominance	203
5.4	Properties of Risk Dominance	209
5.5	Candidate Elimination and Substitution	221
5.6	Solutions of Special Games	230
5.7	Summary of Procedures	240
6	A Bargaining Problem with Transaction Costs on One Side	243
6.1	Introduction	243
6.2	The Model	244
6.3	Properties of ε -Perturbations	245
6.4	Decomposition and Reduction	246
6.5	Initial Candidates	248
6.6	Risk Dominance between Pairs of Initial Candidates	248
6.7	The Limit Solution	260
6.8	The Asymptotic Solution	265
6.9	Other Kinds of Transaction Costs	268
6.10	Transaction Costs on Both Sides	270

7	Trade Involving One Seller and More Than One Potential Buyer	273
7.1	Introduction	273
7.2	The Discrete Version G^* of G and the Uniformly Perturbed Standard Form G_ϵ^*	273
7.3	Primitive Equilibrium Points	275
7.4	Bicentric Priors	276
7.5	Risk-Dominance Relations	278
7.6	Global Conspicuous Risk Dominance: The Solution	281
7.7	Analysis of the Game in Terms of Commonsense Subjective-Probability Judgments	282
7.8	Comparison with the Shapley Value	283
8	Two-Person Bargaining Games with Incomplete Information on One Side	285
8.1	Introduction	285
8.2	The Discrete Version $G^*(\alpha)$ of Game $G(\alpha)$ and the Uniformly Perturbed Standard Form $G_\epsilon^*(\alpha)$	285
8.3	Equilibrium Points	286
8.4	Dominance Relations in Class A°	288
8.5	Dominance Relations in Class B°	298
8.6	Risk-Dominance and Payoff-Dominance Relations between Two Equilibria Belonging to Different Classes	300
8.7	Dominance Relations between the Two Class Leaders	306
8.8	Strategic Net Distances	306
8.9	The Solution	307
9	Two-Person Bargaining Games with Incomplete Information on Both Sides	311
9.1	Introduction	311
9.2	The Discrete Version $G^*(\alpha)$ of Game $G(\alpha)$ and the Uniformly Perturbed Games $G_\epsilon^*(\alpha)$	313
9.3	Maximin Payoff Demands and Maximin Payoffs	315
9.4	Equilibrium Points	317
9.5	Dominance Relations in Class A	325

9.6	Dominance Relations in Class B	325
9.7	Dominance Relations between the Two Class Leaders a^* and b^o	330
9.8	Essential Strategic Distances	336
9.9	The Solution	338
10	Postscript	341
	THE NATURE OF OUR THEORY	341
10.1	Introduction	341
10.2	The Basic Aim of Our Theory	341
10.3	Endogenous Expectations	342
	STABILITY CRITERIA FOR EQUILIBRIUM POINTS	343
10.4	Uniform Perfectness versus Perfectness	343
10.5	Perfectness versus Sequentiality	344
10.6	Normal-Form Dependence: An Example	344
10.7	Another Example	348
10.8	A Third Example	350
10.9	The Assumption of Specific Mistake Probabilities	353
10.10	Preference for Equilibria with Stability Properties Additional to Uniform Perfectness	354
	GAME-THEORETIC RATIONALITY	355
10.11	Payoff Dominance and Risk Dominance	355
10.12	Would a Solution Theory Based Solely on Risk Dominance be Preferable?	357
10.13	Bicentric Priors and the Tracing Procedure	359
10.14	The Role of Strategic Net Distance	361
10.15	Possible Refinements to Our Theory	362
	Notes	365
	Bibliography	369
	Index	373
