CONTENTS

Preface *ix*

Part 1

General Principles and Techniques

1. The necessity of mathematics *3*

1.1. Counting and measurement, 3
1.2. Mathematical descriptions, 7
1.3. Dynamic models, 13
1.4. Levels of application, 19

2. The role of probability and statistics *23*

2.1. Biological variation and probability, 23
2.2. The use of statistics, 27
2.3. Experimental design, 31
2.4. Stochastic processes, 35
2.5. Simulation and Monte Carlo methods, 41

3. The process of scientific research *45*

3.1. The scientific method, 45
3.2. The function of mathematical models, 49
3.3. Models of inference, 52
3.4. The multiplicity of mathematical techniques, 59

4. The scope of operational research *66*

4.1. General scope and definition, 66
4.2. Origins and development, 68
4.3. Some operational research techniques, 71
4.4. The multidisciplinary approach, 83

5. The influence of automatic computers *86*

5.1. General principles, 86
5.2. Scientific computing and numerical analysis, 91
5.3. Data processing, 95
5.4. Computer programming, 98
5.5. Computers and research, 104

6. Teams, projects and organizations *109*

6.1. Introduction, 109
6.2. Teaching, consultation and research, 112
6.3. Cooperative research, 120
6.4. The organization of biomathematics, 124

Part 2

Special Applications

7. Numerical taxonomy *133*

7.1. Introduction, 133
7.2. Basic ideas of classification, 136
7.3. Principles of numerical taxonomy, 138
7.4. The estimation of similarity, 141
7.5. The construction of phenons, 147
7.6. Applications and discussion, 152

8. Population growth and ecology *154*

8.1. Introduction, 154
8.2. Birth-and-death processes, 155
8.3. Multidimensional processes, 165
8.4. Interaction between species, 175
8.5. Discussion, 179

9. Theory of epidemics *182*

9.1. Introduction, 182
9.2. Simple epidemics, 184
9.3. General epidemics, 189
9.4. Recurrent epidemics, 193
9.5. Chain-binomial models, 197
9.6. Infectious and latent periods, 201
9.7. Spatial models, 205

10. Genetic linkage and chromosome maps *211*

10.1. Introduction, 211
10.2. Simple linkage experiments, 215
10.3. Balanced triple backcrosses, 222
10.4. Simple chromosome mapping, 228
10.5. Interference metrics, 232

11. Mathematical methods of medical diagnosis *238*

11.1. Introduction, 238
11.2. Elementary discrimination between two diseases, 240
11.3. The general case of several diseases, 244
11.4. Use of small samples of data, 250
11.5. Significance tests, 255
11.6. Discussion, 259

12. Operational research in medicine *261*

12.1. Introduction, 261
12.2. The demand for medical care, 262
12.3. The design of hospitals, 269
12.4. Outpatient appointment systems, 275
12.5. The study and control of complex systems, 279
