

TABLE OF CONTENTS

Chapter 1. A Brief Review of Enzyme Kinetics	1
Chapter 2. Models for Enzymatically Active Membranes	13
2.1 Modeling of the physiological phenomena using Briggs-Haldane approximations	13
2.2 Control problems arising in connection with membrane models	22
2.3 Hysteresis and oscillatory phenomena in membrane models	25
Chapter 3. Modeling of Enzyme Cascades	27
3.1 Physiological motivation and a review of previous modeling attempts	27
3.2 Derivation of a model based on the cascade in glycogenolysis	36
3.3 The role of optimality in model development	40
3.4 Qualitative and numerical results	42
3.5 Glycogenolytic cascade models with activators/inhibitors	48
Chapter 4. Modeling and Control of Epidemics	52
Chapter 5. Modeling of the Control System in Glucose Homeostasis	67
Chapter 6. Modeling and Control of Tumor Growth	76
6.1 Probabilistic models	76
6.2 Deterministic models	78
6.3 Optimal fractionated therapy	87
Chapter 7. A Survey of Recent Efforts	90
7.1 Biped locomotion	90
7.2 Countercurrent dialysis	94
7.3 Drug regimens	96
7.4 Insect respiration	99
7.5 Patient care and diagnostic models	101
7.6 Ecological systems and resource management	102
7.7 Parameter estimation and identification	102
7.8 Miscellaneous topics	103
Bibliography	104
