

Table of Contents

Preface.....	vii
1. Mathematical Models to Provide Applications in the Classroom... <i>Donald R. Kerr, Jr.</i> , Indiana University, Bloomington, Indiana <i>Daniel Maki</i> , Indiana University, Bloomington, Indiana The process of mathematical modeling is described and is illustrated by examples from other articles. The step of making a classroom model is introduced.	1
2. Applications: Why, Which, and How..... <i>Richard Lesh</i> , Northwestern University, Evanston, Illinois Fred Fleener, a teacher who would like to bring greater focus on applications to his junior high mathematics classroom, converses with Maude McCall, his former supervising teacher, in an effort to get answers to questions about “why,” “which,” and “how.”	8
3. Applications in Elementary Algebra and Geometry <i>Zalman Usiskin</i> , The University of Chicago, Chicago, Illinois The suitability of standard algebra and geometry content for work with applications is discussed. General ways of thinking about applications in these courses are presented through numerous specific examples.	20
4. Applications through Direct Quote Word Problems..... <i>Aron Pinker</i> , Frostburg State College, Frostburg, Maryland Models of word problems are presented that are based on direct quotes from published sources and that exhibit the applicability of mathematics.	31
5. Applications in School Mathematics: Human Variability..... <i>David L. Pagni</i> , California State University, Fullerton, Fullerton, California Activities that deal with human variability involve students in the application of mathematics in the classroom. Interesting human traits can be measured, counted, graphed, and analyzed at all levels, K-12.	43

6. Mauka-Makai and Other Directions..... 59
Nancy C. Whitman, University Laboratory School,
 University of Hawaii at Manoa, Honolulu, Hawaii
 Examples show how narratives can be used in the classroom to help students relate the abstract ideas of mathematics to real or physical situations.
7. This Is Your Life: An Applied Mathematics Curriculum
 for Young Adults..... 70
Elaine R. Lindsay, Pacoima Junior High School, Pacoima,
 California
 Dramatizing the uses of arithmetic in situations that are alive and meaningful to young adults is the aim of this flexible curriculum.
8. Symmetry Along with Other Mathematical Concepts and
 Applications in African Life..... 82
Claudia Zaslavsky, New York, New York
 Integration of mathematics with language arts, social studies, fine arts, and other disciplines is demonstrated by a presentation of activities for the middle grades. African culture provides a model for this interdisciplinary approach to the study of mathematics.
9. Some Everyday Applications of the Theory of Interest..... 98
Lester H. Lange, San José State University, San Jose, California
 Useful, easily derived formulas and exercises about savings accounts and time payments are presented. Other examples, such as deferred income plans and inflation, involve the elementary aspects of principal, percent, and interest that permeate our daily lives.
10. The Mathematics of Finance Revisited through the Hand
 Calculator..... 109
Bert K. Waits, The Ohio State University, Columbus, Ohio
 A variety of ways are provided to use the calculator to assist in the teaching of interesting and useful consumer mathematics applications. For example, your students can easily learn how to compute car loan payments, home loan payments, and “rule of 78” interest rebates.
11. Vibes—the Long and Short of It 125
Sandra Skeen Savage, Orange Coast College, Costa Mesa,
 California
 A specific application of mathematics to music is presented as a teaching unit designed for use in the middle grades.

12. Wildlife, Unemployment, and Insects: Mathematical Modeling in Elementary Algebra 137
David C. Johnson, Chelsea College, University of London, London, England
 Some real-life examples, with accompanying student worksheets, aid in teaching about mathematical modeling within the present elementary algebra curriculum.
13. Applying Mathematics to Environmental Problems 149
Diane Thiessen, University of Northern Iowa, Cedar Falls, Iowa
Margaret Wild, Southern Illinois University, Carbondale, Illinois
 An alternative to traditional story problems is presented through problem-solving situations involving environmental issues.
14. Making Time for the Basics: Some Thoughts on Viable Alternatives within a Balanced Mathematics Program..... 159
Thomas R. Post, University of Minnesota, Minneapolis, Minnesota
 The conceptualization of basic skills is expanded to include environmental applications and logic-oriented or structural mathematics. A case is made for a more broadly defined mathematics program. Examples are given.
15. Developing Classroom Applications Based on Socioeconomic Problems 172
Joseph Fishman, The College of Staten Island, The City University of New York, Staten Island, New York
 A general procedure for using socioeconomic problems to develop mathematics applications in the classroom is discussed. A sequence of problems related to an aspect of the energy crisis serves as a model.
16. Capture-Recapture Techniques as an Introduction to Statistical Inference..... 185
James H. Swift, Nanaimo District Senior Secondary School, Nanaimo, British Columbia
 A unit that introduces statistical inference is described. Samples are taken from a squirrel population and used to estimate the size of the population.
17. Applications for the Classroom—Any Grade..... 193
Peter Weygang, Thomas Aquinas Junior High School, Kenora, Ontario
 Making real-life applications fit for student consumption is the central theme of this article.

18. Applications of Curves of Constant Width..... 205
Douglas A. Grouws, University of Missouri, Columbia, Missouri
Applications of curves of constant width are presented for use in motivating students while teaching such standard topics as circles, areas, and perimeters.
19. Mathematical Modeling and Cool Buttermilk in the Summer..... 217
Mary Kay Corbitt, The University of Georgia, Athens, Georgia
C. H. Edwards, Jr., The University of Georgia, Athens, Georgia
The process of mathematical modeling is illustrated in the context of determining temperature variation in an underground cellar.
20. Applications in Mathematics: An Annotated Bibliography 227
Bernice Kastner, Montgomery College, Rockville, Maryland
Louise S. Grinstein, Kingsborough Community College of the City University of New York, Brooklyn, New York
Sidney L. Rachlin, The University of Calgary, Calgary, Alberta
This comprehensive guide to current literature describes interesting and up-to-date uses of all levels of school mathematics.
