

## CONTENTS

Foreword by W.A. Brock	xi
Preface	xiii
Acknowledgments	xvii
Chapter 1. Results from probability	1
1. Introduction	1
2. Probability spaces	1
3. Random variables	4
4. Expectation	8
5. Conditional probability	12
6. Martingales and applications	16
7. Stochastic processes	32
8. Optimal stopping	43
9. Miscellaneous applications and exercises	57
10. Further remarks and references	60
Chapter 2. Stochastic calculus	65
1. Introduction	65
2. Modeling uncertainty	65
3. Stochastic integration	69
4. Itô's lemma	80
5. Examples	89
6. Stochastic differential equations	92
7. Properties of solutions	96
8. Point equilibrium and stability	102

9.	Existence of stationary distribution	106
10.	Stochastic control	108
11.	Bismut's approach	118
12.	Jump processes	121
13.	Optimal stopping and free boundary problems	124
14.	Miscellaneous applications and exercises	128
15.	Further remarks and references	132
Chapter 3. Applications in economics		141
1.	Introduction	141
2.	Neoclassical economic growth under uncertainty	141
3.	Growth in an open economy under uncertainty	143
4.	Growth under uncertainty: Properties of solutions	144
5.	Growth under uncertainty: Stationary distribution	146
6.	The stochastic Ramsey problem	148
7.	Bismut on optimal growth	150
8.	The rational expectations hypothesis	153
9.	Investment under uncertainty	157
*10.	Competitive processes, transversality condition and convergence	161
*11.	Rational expectations equilibrium	168
12.	Linear quadratic objective function	172
13.	State valuation functions of exponential form	173
14.	Money, prices and inflation	178
*15.	An $N$ -sector discrete growth model	182
16.	Competitive firm under price uncertainty	188
17.	Stabilization in the presence of stochastic disturbances	192
18.	Stochastic capital theory in continuous time	194
19.	Miscellaneous applications and exercises	205
20.	Further remarks and references	214
Chapter 4. Applications in finance		217
1.	Introduction	217
2.	Stochastic rate of inflation	217
3.	The Black–Scholes option pricing model	220
4.	Consumption and portfolio rules	223
5.	Hyperbolic absolute risk aversion functions	226

6. Portfolio jump processes	228
7. The demand for index bonds	230
8. Term structure in an efficient market	233
9. Market risk adjustment in project valuation	236
10. Demand for cash balances	238
*11. The price of systematic risk	242
*12. An asset pricing model	246
*13. Existence of an asset pricing function	254
*14. Certainty equivalence formulae	256
*15. A testable formula	262
*16. An example	264
17. Miscellaneous applications and exercises	268
18. Further remarks and references	272
Selected bibliography	279
Author index	295
Subject index	299
