1 Overview of the Book	1
Summarizing the main themes running through the book	
2 Instruments and Instrument Design	24
Criteria for constructing data collecting instruments	
3 Controlled Experiments	59
Introducing the logic of control as exemplified in controlled experiments	
4 More Naturalism in Experiments	85
Considering the merits and the problems of relaxing experimental control in order to make a controlled experiment more naturalistic	
5 Computer Simulations and Complexity Theory	111
Outlining the role of computer simulations in social research with particular reference to the simulation of complex phenomena	
6 Sample Surveys and Statistical Representativeness	129
Introducing surveys, sampling and statistical representativeness as the basis for empirical generalization	
7 Natural Experiments	158
Introducing and illustrating the ideas of natural experiments and statistical control	
8 Controlling for Time in Natural Experiments	183
Considering the importance of establishing time sequence in natural experiments and the use of longitudinal research	

9	Using Administrative Data in Research	196
	Outlining the problems of using administrative data in social research	
10	Questions and Answers	208
	Comparing questioning for social surveys with questioning in qualitative interviews and the data arising	
11	Analysing the Results of Qualitative Interviews	239
	Demonstrating three different ways of analysing qualitative interview data	
12	Observing Naturally Occurring Events	268
	Considering the strategies of naturalistic observation	
13	Analysing Written Documents	295
	Explaining some techniques for analysing written documents both as topics and as resources	
14	Evaluative and Emancipatory Research	322
	Considering the role of values in research and the differences between value-neutral and value-led research	
15	Systematic Reviews, Meta-Analysis and Syntheses from Diverse Sources	344
	Explaining the various strategies adopted to synthesize the results of different pieces of research	
16	Research Ethics	365
	Outlining different views on the proper moral conduct for social researchers	
	<i>References</i>	391
	<i>Index</i>	419

List of Figures

2.1	Reading scores at 16 years for top scoring 11 year olds	32
2.2	A similar-subjects, different-treatments experimental design used to investigate alternatives in the content or the administration of instruments	50
3.1	The basic structure of a controlled experiment with similar subjects experiencing different treatments or conditions	60
3.2	The main sources of confounding in controlled experiments	62
3.3	The normal distribution as a frequency distribution of chance outcomes	78
4.1	A different-subjects, similar-treatments experimental design	93
5.1	An example from the beginning of a diffusion simulation, executed with CA	116
5.2	Three kinds of graph: ordered, small world and random	122
5.3	Bell curve distribution of node links, on arithmetic graph	123
5.4	Power law distribution of node links: on arithmetic graph	123
5.5	Power law distribution of node links: on log log scale graph	123
5.6	Normal distribution: a representative data set includes many items with middling values; fewer larger and fewer smaller than this	125
5.7	Power law distribution: with an inverse power law a representative data set has a few very large items with very high values and increasing numbers with increasingly small values	125
5.8	Normal distribution: each additional sample added to previous ones will result in less change to the grand mean	125
5.9	Power law distribution: with an inverse power law, each new sample added to the previous ones will change the grand mean, making it smaller with most samples, and occasionally bigger	125
6.1	Confidence limits for males and females answering 'Yes' to the survey question	149
6.2	Factors likely to influence the results of a sample survey	156
7.1	Explaining by reducing prediction errors	169
7.2	Actual school average examination scores plotted against scores predicted from knowledge of school's social class and gender composition and percentages of pupils receiving free school meals: 74 schools in the state sector, Nottinghamshire, 1991	173
7.3	Uncontrolled aspects of 'social class' when social class is defined by occupation	177

7.4	Social class, gender, parental interest and reading scores	181
9.1	Goldberg and Huxley's filter model of mental illness	198
9.2	Standardized Mortality Ratios (SMRs) for selected causes of death, by social class (based on occupation) men aged 20–64, England and Wales, 1991–3	200
10.1	Reasons for differences and similarities shown between respondents in research involving questioning and answering	209
12.1	Levels of selection in an observation study: what influences whether data are selected in, or selected out?	270
12.2	The window of observation in observation research	274
13.1	The consultant's decision as a problem–solution discourse	312
15.1	Odds ratios and 95% confidence intervals for effects of young offenders' programme: Forest Plot	352

List of Tables

1.1	Two approaches to the meaning of what people say, or otherwise communicate	9
1.2	Traditional criteria for judging research compared with some alternatives proposed for qualitative social research	13
2.1	Levels of data	27
2.2	An example of a ranking scale: generating ordinal data	28
2.3	An example of a rating scale: generating plastic interval data	28
2.4	The effect of different scales on the information captured	31
2.5	Criteria for research instruments	34
2.6	An example of a factor analysis matrix: role score correlations	47
3.1	Kinds of blinding in experimental research	74
3.2	Outcomes of experimental evaluation of drug education programme delivered at age 11–12, outcomes in terms of smoking behaviour at age 13–14	77
3.3	Data from Table 3.2 laid out for X^2 calculation	79
3.4	Extract from table of critical values for X^2	80
3.5	Values of p	81
4.1	Responses to requests for directions by researcher in different roles in a university hospital precinct, and on the university campus	88
4.2	Verdicts of five Danish Kredsrae and four English coroners on the same 40 cases	92
4.3	Experimental control and experimental results: research on programmes to reduce crime and delinquency	97
4.4	Topics for which research is more or less likely to produce sound generalizations	103
4.5	Cross-mapping local circumstances against a research project	105
4.6	Grid for comparing Rosenhan's experiment with Gomm's experiment for Activity	108
5.1	The process of simulation	113
6.1	Population for sampling for a survey of illicit drug use by gender, age and ethnicity	132
6.2	Disproportional stratified probability sample for the population of young people in Slegborough as shown in Table 6.1: gender, ethnic and age strata	142
6.3	Survey results	144

6.4	Sensitivity analysis of survey results shown in Table 6.3: sensitivity of results to combinations of different assumptions about behaviour of survey non-respondents	144
6.5	Size of a sample required for various population sizes in order to produce an estimate of a dichotomous variable in a population, accurate to $\pm 5\%$ or better, with 95% confidence about being right	146
7.1	Controlled experiments and natural experiments compared as ways of studying causality	160
7.2	A statistical control structure for studying the relative influence of heredity and environment on characteristics such as intelligence or personality traits	162
7.3	Examples of pupil-level and school-level variables	166
7.4	The social class composition of schools and their average achievements in 16+ examinations (GCSEs): Nottinghamshire, 1991	170
7.5	Ready-reckoner for calculating the predicted GCSE scores of pupils from a knowledge of various pupil characteristics	171
8.1	Some of the problems of longitudinal survey designs	188
8.2	The kinds of data needed for a longitudinal survey to be adequate as the basis for a prospective natural experiment	189
8.3	An example of a medical cohort study: doctors, smoking and death	190
10.1	Modes of administering questionnaires: face to face, by telephone, postal and otherwise	214
10.2	Advantages and disadvantages of computer aided interviewing (CAPI, CASI and CATI) by comparison with paper and pencil-based interviewing	215
10.3	Intimacy and anonymity in disclosure: reports of numbers of cigarettes smoked daily at the beginning of pregnancy as reported in hospital records, by mothers interviewed at home and in postal questionnaires	215
10.4	A comparison between interviewing for social surveys and qualitative interviewing	234
11.1	Agentive and non-agentive attributions: coding frame for a thematic analysis	247
12.1	Sampling, representativeness and generalizations from observation research	276
12.2	Observation schedule for observing teachers' behaviour in the classroom	283
12.3	Theoretical sampling frame implied by Cicourel and Kitsuse's (1963) study of Lakeside High	286
13.1	Table for presenting some results of a quantitative analysis of news stories about HIV/AIDS	302
13.2	Some ideas from MCA	307
13.3	Components of a complete problem-solution discourse	309
13.4	Credibility markers in feminist, anti-racist and other socially critical texts	314

13.5	Credibility markers in mainstream social science research	315
14.1	Questions to ask about performance indicators	342
15.1	Meta-analysis of five studies of the effectiveness of a custodial regime for young offenders	350
15.2	Outcome of study 1 in Table 15.1	351
15.3	Commensurability problems in statistical meta-analysis	353
16.1	Doing good and harm to subjects in doing research	371

List of Panels

2.1	Question formats	30
2.2	A ceiling effect in <i>Progress in Secondary Schools</i>	32
2.3	Correlation and co-variance	40
2.4	Testing intelligence tests for criterion validity	41
2.5	Measuring pupils' (views on each others') participation in bullying	45
2.6	Inter-rater reliability testing: an example	49
2.7	Various meanings of standardization	51
2.8	Standardization and the normal distribution	52
2.9	<i>Pygmalion in the classroom</i> : an example of using a test without appropriate norms	55
2.10	Culture-fair instruments	56
3.1	Normal distribution: the distribution of chance outcomes and inferential statistics	78
4.1	A recipe for bias	98
5.1	Difficulties in validating simulations	115
5.2	Program specifications for a cellular automata simulation of rumour diffusion	116
5.3	Some propositions about complex phenomena	119
5.4	Ordered, random and scale-free networks	122
5.5	Properties of random and small-world (scale-free) networks	123
5.6	Normally distributed data compared with power law distributed data	125
6.1	Statistically representative samples for surveys	135
6.2	Calculating confidence intervals for surveys	149
6.3	Samples other than probability or quota samples	152
8.1	The difficulties of relying on memories to reconstruct the past	185
10.1	How survey responses might have been different	212
10.2	Differences in questioning strategy and wording between an NHS consumer satisfaction survey in Lothian and one covering the whole of Scotland	221
10.3	Some circumstances leading to large interviewer effects: that is, when there are large differences between the responses elicited from the same kinds of people by different interviewers, using the same questions	222
10.4	The 'ethnic' question in the Census 2001 and 1991	236
12.1	Structured observation to produce numerical data from naturally occurring situations	282

13.1	Content analysis frame for preliminary analysis of newspaper stories on HIV/AIDS	299
13.2	Questions to ask about witness evidence	317
13.3	Different kinds of triangulation	318
14.1	Pluralistic evaluation: different notions of 'success' in a psychogeriatric day hospital	331
15.1	The usual characteristics of a systematic review	346
15.2	Scale for measuring the quality of randomized trials	347
15.3	Publication bias	348
15.4	The confidence intervals of odds ratios (ORs)	351
16.1	The Principles of Ethical Research laid down by the Economic and Social Research Council (ESRC)	366
16.2	Informed consent	376

List of Transcripts

10.1	The research interview	224
11.1	Transcript coded for themes in a thematic analysis	245
11.2	Transcript coded for illocutions: sequential analysis	259
11.3	Extract from focus group for analysis in Activity	264

List of Activities

A truancy counter	58
Designing a controlled experiment	83
Specifying the variables which might make a difference to the research outcomes	107
Simulating a phenomenon	127
Guarding against unrepresentativeness	155
Controlling variables in explaining reading scores	181
Social class as a variable fixed in time or varying through time	192
Modelling the production of official statistics on crime	206
Designing 'ethnic' questions	236
Analysing data from a focus group	264
Observing and disrupting turn-taking	293
Deconstruction through reconstruction	320
Appraising a performance indicator	341
Updating belief	355
Ethically appraising research	389
