

CONTENTS

1	Introduction to Crystal Dislocations	1
1.1	Perfect Crystal Structures	2
1.1.1	Lattices and Bases	2
1.1.2	Miller Indices	5
	Summary	5
	Problems	6
1.2	The Concept of Crystal Dislocations	6
1.2.1	How to Make a Dislocation	6
1.2.2	The Burgers Vector	10
	Summary	13
	Problems	14
1.3	Motion of a Crystal Dislocation	15
1.3.1	Driving Forces for Dislocation Motion	16
1.3.2	Conservative versus Non-conservative Motion	18
1.3.3	Atomistic Mechanisms of Dislocation Motion	20
	Summary	23
I	ATOMISTIC MODELS	
2	Fundamentals of Atomistic Simulations	27
2.1	Interatomic Interactions	27
2.1.1	Interatomic Potential Models	28
2.1.2	Locality of Interatomic Interactions	32
2.1.3	Computational Cost of Interatomic Interaction	
	Models	33
	Summary	35
	Problem	36
2.2	Equilibrium Distribution	36
	Summary	38
	Problems	39
2.3	Energy Minimization	39
2.3.1	The Steepest-descent Method	40
2.3.2	Conjugate Gradient Relaxation	41
2.3.3	Global Minimization	42
	Summary	43

2.4	Monte Carlo	44
2.4.1	Average over the Configurational Space	44
2.4.2	Designing a Stochastic Monte Carlo Process	45
2.4.3	Metropolis Algorithm	46
	Summary	47
	Problems	47
2.5	Molecular Dynamics	48
2.5.1	The Verlet Algorithm	49
2.5.2	The Velocity Verlet Algorithm	49
2.5.3	Energy Conservation	50
	Summary	51
	Problems	51
3	Case Study of Static Simulation	53
3.1	Setting up an Initial Configuration	53
	Summary	57
	Problem	57
3.2	Boundary Conditions	58
3.2.1	Periodic Boundary Conditions	59
	Summary	62
	Problem	62
3.3	Data Analysis and Visualization	63
	Summary	67
	Problems	68
4	Case Study of Dynamic Simulation	69
4.1	Setting up an Initial Configuration	69
	Summary	71
4.2	Initializing Atomic Velocities	71
	Summary	74
	Problem	74
4.3	Stress Control	75
	Summary	77
4.4	Temperature Control	78
4.4.1	Ensembles and Extended Systems	78
4.4.2	Nose–Hoover Thermostat	79
	Summary	81
	Problem	81
4.5	Extracting Dislocation Velocity	81
	Summary	83
	Problem	83

5	More about Periodic Boundary Conditions	84
5.1	Setting up an Initial Configuration	85
5.1.1	A Naive Approach	85
5.1.2	Conditional Convergence and the Linear Error Field	87
5.1.3	Adjusting the Shape of the Supercell	89
	Summary	91
	Problem	92
5.2	Dislocation Core Energy	92
	Summary	95
	Problems	96
5.3	Peierls Stress	96
	Summary	98
	Problems	98
6	Free-energy Calculations	101
6.1	Introduction to Free Energy	101
6.1.1	Free Energies of Configurational States	102
	Summary	104
6.2	Harmonic Approximation	104
6.2.1	Free Energy of a Vacancy in the Dislocation Core	106
6.2.2	Bookkeeping of the Free Energies	107
	Summary	108
	Problems	109
6.3	Beyond Harmonic Approximation	109
6.3.1	Free Energy of a Core Vacancy Revisited	113
	Summary	116
	Problems	116
7	Finding Transition Pathways	117
7.1	The Rare Event Problem	117
	Summary	119
7.2	Transition State Theory	119
	Summary	121
7.3	Local Path Optimization	122
7.3.1	Constrained Minimization	122
7.3.2	The Chain of States Method	124
7.3.3	Case Study: Kink Migration in Silicon	126
	Summary	128
7.4	Global Path Optimization	128
7.4.1	Case Study I: The Two-dimensional Potential	130
7.4.2	Case Study II: Kink Migration in Silicon Revisited	131
	Summary	132

7.5	Temperature-accelerated Sampling	132
7.5.1	Case Study: Kink Migration in Silicon Yet Again	134
	Summary	136
II	CONTINUUM MODELS	
8	Peierls–Nabarro Model of Dislocations	139
8.1	Model Formulation	140
8.1.1	Volterra Model Versus Peierls–Nabarro Model of Dislocations	140
8.1.2	Elastic Energy of the PN Dislocation	142
8.1.3	The Misfit Energy	143
8.1.4	The Analytic Solution	145
	Summary	146
	Problems	146
8.2	Numerical Solutions	147
8.2.1	The Sinusoid Misfit Potential	148
8.2.2	Misfit Potential with Intermediate Minima	149
	Summary	152
8.3	Extension to Two Displacement Components	152
8.3.1	Numerical Solutions	156
8.3.2	Stress Effects	158
	Summary	160
	Problems	160
8.4	Further Extensions	162
8.4.1	Lattice Resistance to Dislocation Motion	162
8.4.2	Non-locality of Dislocation Energy	163
8.4.3	More Complex Dislocation Geometries	163
	Summary	163
	Problems	164
9	Kinetic Monte Carlo Method	166
9.1	Non-interacting Model	167
9.1.1	Model Formulation	169
9.1.2	Markov Chains	171
9.1.3	Kinetic Monte Carlo Algorithm	171
	Summary	174
	Problems	174
9.2	Dealing with Elastic Interactions	176
9.2.1	Model Formulation	176
9.2.2	Expressions for the Elastic Energy of a Kinked Dislocation	176

9.2.3	Energy of a Kink Pair	179
9.2.4	Computing Energy Changes due to Segment Motion	180
9.2.5	Kinetic Monte Carlo Simulation Results	182
	Summary	183
9.3	Kink Pair Nucleation as a Rare Event	183
9.3.1	Sustainable Kink Pair Nucleation	184
9.3.2	Survival Probability	185
9.3.3	Average Time of First Arrival	188
9.3.4	Probability Distribution for the First Arrival Time	189
9.3.5	An Enhanced kMC Simulation	192
	Summary	194
	Problems	195
10	Line Dislocation Dynamics	196
10.1	Nodal Representation and Forces	197
10.1.1	Nodal Representation of Dislocation Networks	197
10.1.2	Energy and Forces	199
10.1.3	Elastic Energy and Force Contributions	199
10.1.4	Core Energy and Force Contributions	203
10.1.5	Periodic Boundary Conditions	204
	Summary	205
	Problems	205
10.2	Nodal Mobility Functions	208
10.2.1	A Linear Mobility Model	209
10.2.2	A Mobility Model for FCC Metals	211
10.2.3	A Mobility Model for BCC Metals	213
	Summary	214
	Problems	214
10.3	Time Integrators	214
10.3.1	An Example: Frank–Read Source	216
	Summary	218
10.4	Topological Changes	218
10.4.1	Remeshing	219
10.4.2	Split and Merge Operators	221
10.4.3	When and How to Use <i>merge</i>	223
10.4.4	When and How to <i>split</i> a Node	224
10.4.5	A Complete Line DD Algorithm	226
10.4.6	Frank–Read Source Revisited	226
	Summary	227
	Problems	228
10.5	Parallel Simulations	229
10.5.1	Scalability	230

10.5.2	Spatial Domain Decomposition	231
10.5.3	Dynamic Load Balance	233
10.5.4	Single-Processor Performance	235
	Summary	236
	Problem	236
10.6	A Virtual Straining Test	236
10.6.1	Mobility Function	237
10.6.2	Boundary and Initial Conditions	237
10.6.3	Loading Condition	237
10.6.4	Results	239
	Summary	240
11	Phase Field Method	241
11.1	General Phase Field Approach	242
11.1.1	Case A (Relaxational or Ginzburg–Landau)	243
11.1.2	Case B (Diffusional or Cahn–Hilliard)	248
	Summary	250
	Problems	251
11.2	Dislocations as Phase-Field Objects	251
11.2.1	The Elastic Energy	254
11.2.2	The Lattice Energy	254
11.2.3	The Gradient Energy	255
	Summary	256
11.3	Elastic Energy of Eigenstrain Fields	256
11.3.1	Useful Expressions in the Fourier Space	259
11.3.2	Stress Expressions in Two Dimensions	260
	Summary	261
	Problem	261
11.4	A Two-Dimensional Example	262
	Summary	264
	Problems	265
11.5	Dislocation–Alloy Interaction	266
	Summary	269
	Problems	269
11.6	PFM or Line DD?	271
	Summary	274
	Bibliography	275
	Subject Index	281
