<i>Preface</i>	vii
1 History of speech synthesis – from talking gods to talking computers	1
1.1 Talking gods	1
1.2 The evolution of speech	2
1.3 Von Kempelen	4
1.4 The nineteenth century	8
1.5 Sir Richard Paget	10
1.6 Electronic synthesisers	13
1.7 The future	16
2 Human and synthetic speech: the problem – articulatory and acoustic description of speech	18
2.1 Human speech production	18
2.2 The articulators	19
2.3 Articulatory gestures	22
2.4 Co-articulation	27
2.5 Spectrograms	29
3 Articulatory synthesis – modelling the speech production mechanism	38
3.1 Introduction	38
3.2 Basic acoustical analysis	39
3.3 Acoustic losses	43
3.4 Nasal tract	46
3.5 Acoustic radiation	48
3.6 Glottal excitation	49
3.7 Vocal cord model	53
3.8 Electrical transmission line analogues	56
3.9 Computational model	59

3.10	Digital transmission lines	61
3.11	Area functions	64
4	Spectrum synthesis – modelling speech by modelling its spectrum	67
4.1	Introduction	67
4.2	Channel synthesisers	69
4.3	Formant synthesisers	70
4.4	Analogue circuits for formant synthesis	75
4.5	Digital formant synthesisers	81
4.6	Excitation of terminal analogue synthesisers	89
5	Synthesis in the time domain – modelling the time waveform of the speech signal	95
5.1	Introduction	95
5.2	Linear prediction	97
5.3	Calculating predictor coefficients	103
5.4	Resynthesis problems	106
5.5	Lattice LPC–PARCOR parameters	107
5.6	Inverse filtering	111
5.7	Conclusions	113
6	Synthesising control parameters – the art of producing intelligible, natural-sounding synthetic speech	114
6.1	Introduction	114
6.2	Vocoders	116
6.3	Parametric storage of speech	119
6.4	Synthesis from phonemic specification	120
6.5	Articulatory synthesis	124
6.6	Concatenation of multi-phonemic units	125
6.7	Synthetic stress patterns	128
6.8	Text-to-speech synthesis	133
