Transport Coefficients and Collision Frequencies for Aeronomic Plasmas.

By Professor Dr. Kurt SUCHY, Institut für Theoretische Physik, Universität
Düsseldorf, Universitätsstraße 1, D-4000 Düsseldorf 1 (FRG). (With 40 Figures)

Introduction	57
A. Transport coefficients derived with a mean-collision-frequency method	58
1. Momentum and energy flux balance	58
2. Transport equations	60
B. Gas kinetic cross sections and collision frequencies	62
3. General methods of the kinetic theory	62
I. Transfer cross sections and transfer collision frequencies	63
4. Collision cross sections and collision frequencies	63
5. Quantum corrections to classical transfer cross sections	68
6. Transfer cross sections	70
7. Transfer cross sections for nonmonotonic interaction potentials	76
8. Transfer cross sections for monotonic interactions potentials	87
II. Transfer cross sections for particular interactions	94
9. Collisions between charged and neutral particles	94
10. Collisions between electrons and neutral particles. General features	96
11. Collisions between electrons and aeronomic neutrals	99
12. Collisions between charged particles	105
13. Collisions between ions and neutrals. Polarization part	107
14. Collisions between atomic ions and atoms	110
15. Collisions of ions in their parent gas. Charge exchange	114
16. Collisions of ions on their parent gas. Polarization	120

17. Collisions between neutrals	122
18. Analytic expressions and normalizations for transfer cross sections and transfer collision frequencies	124
III. Transport collision frequencies and their calculation	130
19. Transport collision frequencies	130
20. Transport collision frequencies for multiparameter interaction potentials	139
21. Numerical and analytical results for transport collision frequencies	158
22. Survey of the methods for the determination of transport collision frequencies	162
C. The moment method	167
I. System of balance equations for momentum and heat flux	167
23. Momentum and heat flux balances	167
24. Balance equations in matrix notation	170
II. Transport equations	174
25. Transport equations in zeroth approximation. Ohm's and Fourier's laws	174
26. Transport equations in first approximation. Thermal diffusion and diffusion thermo effect	177
27. Onsager-Casimir relations. Generalized Bridgman relation	181
III. Particular transport coefficients	183
28. Transport coefficients for charged particles and for electrons alone	183
29. Electrical and heat conductivity for an electron plasma	185
30. Thermal diffusion tensor and Peltier tensor for an electron plasma	191
D. The Lorentz method	192
31. Representation of transport coefficients	192
32. Eigenvalues of the transport tensors expressed by Dingle integrals	196
33. Binomial approximations of the transport eigenvalues	200
34. The Ginzburg-Gurevič representation of transport eigenvalues	204
35. The Shkarofsky representation of transport eigenvalues	207
36. Some applications and extensions	208
Appendix	
A. Axial tensors and axial matrix tensors	211
B. Some definite integrals and special functions	215
C. Conversion of units	220
