The Aurora. By S.-I. AKASOFU, Professor of Geophysics, Geophysical Institute, University of Alaska, College, Alaska (USA), S. CHAPMAN, Advisory Scientific Director, Geophysical Institute, University of Alaska; Senior Research Scientist, Institute of Science and Technology, University of Michigan; Member of Research Staff, High Altitude Observatory, Boulder, Colorado (USA), A. B. MEINEL, Director, Steward Observatory, University of Arizona, Tucson, Arizona (USA). (With 114 Figures)	1
I. The geographical distribution of the aurora	2
II. The auroral forms	15
A. The bands	16
B. The surfaces	27
III. The development of auroral displays	32
A. The typical displays seen at a single station	32
B. Dynamics of the auroral displays	37
C. Typical displays on a continental and on a planetary scale	46
IV. The auroras and magnetic storms	52
V. Radio studies of the aurora	69
VI. Auroral particles and the radiation belts	81
A. Motions of charged particles in a dipole field	84
B. Balloon observations of auroral particles	88
C. Rocket observations of auroral particles	95
D. Satellite observations of auroral particles	96
VII. The auroral spectrum	100
A. Description and analysis of the auroral spectrum	106
B. The production of the auroral spectrum	113
C. Special types of aurora	117
D. Upper atmospheric temperatures inferred from auroral spectra	121
VIII. Theories of the aurora	124
A. Historical reviews	124
B. The geomagnetic field bounded by the solar plasma	129
C. The ring current	131
D. The formulation of the problem	133
E. Present theories of the aurora	136

 Time-Variations of Cosmic Rays. By S. E. FORBUSH, Chairman, Section of Analytical and Statistical Geophysics, Department of Terrestrial Magnetism, Carnegie Institution, Washington, D. C. (USA). (With 86 Figures)	 159
First part: Results up to the International Geophysical Year	159
A. Methods of observation	159
B. Atmospheric effects	166
I. Barometer effects	166
II. μ -Meson decay effects and seasonal variations	169

	Page
C. Diurnal variations	171
I. Solar diurnal variations	171
II. Sidereal diurnal variation	178
D. World-wide variations	180
I. Variations associated with magnetic storms	180
II. Geomagnetic activity effects	184
III. Variation with sunspot cycle	193
IV. 27-day variations	198
E. Solar flare effects	204
I. Large increases of cosmic-ray intensity associated with solar flares	204
II. Expected geographical distribution of solar-flare increases if these come from the sun	209
F. Summary of results up to the Geophysical Year	216
Second part: Results obtained in the International Geophysical Year and afterwards	218
G. Solar cycle variations	219
I. Results from ionization chambers and neutron monitors	219
II. Results from high altitude observations	224
H. Forbush decreases	227
I. Results from continuous monitors	227
II. Results from satellites and space probes	232
I. Solar flare effects	234
I. Results from ground level monitors	234
II. Results from other methods of detection	241
References	245
Magnetic Properties of Rocks and Minerals. By T. NAGATA, Professor of Geophysics, Geophysical Institute, Faculty of Science, The University of Tokyo, Tokyo, Japan. (With 46 Figures)	248
I. Magnetism of rock-forming minerals	248
II. Magnetic properties of assemblage of small grains of ferrimagnetic minerals	266
III. Remanent magnetism of rocks	271
