

Table of Contents

1.	Models of the Earth	
1.1	Introduction	1
1.2	Seismic Data	2
1.3	Plate Tectonics	18
1.4	Chemical and Mineralogical Composition of the Crust and Mantle	28
1.4.1	Geophysical Materials	28
1.4.2	Phase Transitions in Basic Rock-Forming Minerals	31
1.4.3	Phase diagram of the System Mg_2SiO_4 - Fe_2Si_4 and Temperature Distributions in the Upper Mantle	39
1.5	Seismic Anisotropy	43
1.5.1	Azimuthal and Polarization Anisotropy	43
1.5.2	Quantitative Distribution of Seismic Anisotropy	46
1.6	Spherically Symmetric, Isotropic Models of the Non-Rotating Earth	49
1.7	Modern Earth Models	51
1.7.1	The PEM's Models. Distribution of Density, Elastic Moduli, Pressure, and Gravity	51
1.7.2	The PREM Model	57
1.7.3	Stratification of the Liquid Core. The <i>Brunt-Väisälä</i> Frequency . . .	62
1.7.4	The Three-Dimensional Global Models of the Earth's Mantle	64
1.7.5	Moment of Inertia of Three-Dimensional Models of the Earth . . .	70
1.7.6	The Seismic Investigation of the Core-Mantle Boundary (CBM) . .	73
1.7.7	Aspherical Structure in the Earth's Inner Core	79
1.8	The Distribution of Temperature in the Earth's Core and Temperature at the CMB	81
1.9	Damping of Free Oscillations, Attenuation of Seismic Waves and Velocity Dispersion	90
1.9.1	The Quality Factor Q	90
1.9.2	Anelasticity and Viscoelasticity	96
1.9.3	The Dynamical Shear Modulus $\mu_D(\omega)$	99

1.9.4	Solid-state Mechanisms of Seismic Wave Attenuation.	106
1.9.5	The Pressure Dependence of Activation Enthalpy $H^*(p)$	109
1.10	The Earth's Gravity Field	111
1.10.1	Decomposition of the Total Gravitational Potential into Spherical Harmonics	111
1.10.2	The External Potential	115
1.10.3	The Elements of Theory Gravity Field and Figure of the Hydrostatically Equilibrium Planets	124
1.10.4	Departure of the Earth's Gravity Field from that of a Planet in Hydrostatic Equilibrium.	129
1.10.5	The Figure of the Earth	133
1.10.6	Interpretation of Long-wavelength Variations in Earth's Geoid. Method of Green Functions	137
2.	The Rotation of the Models of Rigid Earth and an Earth with Elastic Mantle and Liquid Core; the Statical Theory of Tides for Spherically Symmetric Models.	145
2.1	Tide-generating Forces	145
2.2	The Systems of Coordinates; the Equations of Motion in the Mobile Systems of Coordinates	149
2.3	The Kinematical <i>Poinsot's</i> Relations in the Bi-Axial Case (for $A = B$)	151
2.4	The Free and Forced Nutation of the Three-Axial Rigid Body . . .	159
2.4.1	The Kinematics.	159
2.4.2	The Main Long-Periodic Perturbations	163
2.5	The <i>Hough-Sludsky-Poincare's</i> Solution	168
2.6	The Governing Equations for the Elastic Statical Tides; <i>Love</i> Numbers	174
2.6.1	The General Equations of the Partial Derivatives	174
2.6.2	The System of Ordinary Differential Equations for the Statical Tides	175
2.7	The Equations of the Statical Equilibrium of the Liquid Core; the "Statical Core Paradox"	178

2.7.1	The Governing Equations for the Liquid Core	178
2.7.2	“The Statical Core Paradox”.	179
2.7.3	The Conditions of the Statical Equilibrium on the Core-Mantle Boundary	183
2.8	<i>Chandler</i> Wobble for the Model of a Spherically Symmetrical Elastic Earth without Liquid Core and Oceans	184
3.	<i>Green’s</i> Function; the Self-Adjointity of the Operator L; the Application of the Perturbation Method to the Theory of Earth’s Tides	193
3.1	The <i>Green’s</i> Function to the Equations of the Spheroidal Deformations of the Earth	194
3.2	The Application of the Perturbation Method to the Ordinary Differential Equations of the Earth’s Tides	200
3.3	The Connections between <i>Love</i> Numbers and Loading Coefficients	201
3.4	The Self-Adjointity of the Operator L; the Application of the Perturbations Method to the General Equations of Partial Derivatives	205
4.	Governing Equations and Boundary Conditions for Dynamic Tides; Dynamic Effects in the Liquid Core and Elastic Mantle . . .	218
4.1	General Dynamical Equations	219
4.1.1	<i>Lagrangian</i> and <i>Euler’s</i> Equations in the Mobile Reference Frame . .	219
4.1.2	Dynamic Equations for Earth Tides of Different Species	222
4.1.3	Hydrodynamic Equations	223
4.2	BRYAN’s Solution	230
4.3	Tidal Flows in Homogeneous Incompressible Liquid Core	239
4.4	Boundary Conditions for the Deformable Earth	241
4.4.1	Nutation, <i>Chandler</i> Wobble and Diurnal Tides	242
4.4.2	Boundary, Conditions for Semidiurnal and Longperiodic Tides . . .	244
4.5	The Deviation of Tides in the Elastic Mantle from Statical Tides . .	245

4.6	Dynamical Effect of the Liquid Core for Semidiurnal and Longperiodic Tides	250
4.6.1	Semidiurnal Tides	252
4.6.2	Long-Periodic Waves	253
4.7	Direct Influence of Inertial Forces on the Tide Recording Equipment	254
5.	Dissipation of Tidal Energy in an Anelastic Mantle and in the Oceans	260
5.1	The Influence of the Anelasticity of the Mantle on Phase Lags and Amplitudes of Earth Tides	260
5.2	The Secular Increase of the Length of Day Due to the Dissipation of Tidal Energy in an Anelastic Mantle	270
5.3	The Influence of Oceans and the Anelasticity of the Mantle on the Earth's Nutation and <i>Chandlerian</i> Wobble	273
5.3.1	Relations between Off-Diagonals Components of Inertia Tensors, Core-Mantle Radial Displacements, and Variations of Outer Potential	276
5.3.2	The Equation of Angular Momentum of the System (Anelastic Mantle Plus Ocean)	277
5.3.3	The Equation for the Angular Momentum of the Earth as a whole	281
5.3.4	The Continuity Condition at the Core-Mantle Boundary	282
5.3.5	<i>Chandler</i> Wobble	284
5.3.6	Forced Nutation and Nearly Diurnal Free Wobble	287
6.	The Theory of Tides for the Slightly Spherically Nonsymmetrical Models of the Earth	306
6.1	The Presentation of the Earth's Tidal Amplitudes and Phases in Spherical Harmonics Expansions	306

6.2	The Results of Numerical Modeling; on the Possibilities of Investigating Large-Scale Lateral Heterogeneities of the Mantle Based on Tidal Measurements	318
-----	--	-----

Appendix 1: The calculation of integrals (4.84)

Appendix 2: The proof of relations (6.14)–(6.15)

7.	Nutation, Polar Motion and Global Tidal Parameters	326
7.1	Observations of Polar Motion and Nutation	327
7.2	The Celestial Ephemeris Pole (CEP)	327
7.3	Nutation Versus Polar Motion	332
7.3.1	Lunisolar Effects	333
7.3.2	Geophysical Perturbations	338
7.4	Equations of Polar Motion	341
7.4.1	The Effective Angular Momentum (EAM) Function χ	342
7.4.2	Polar Motion Equations Related to the CEP	346
7.4.3	Diurnal Excitations expressed by the EAM Function	348
7.4.4	Diurnal Polar Motion Expressed by the Celestial Coordinates of the CEP	352
7.4.5	Analytical Solutions	354
7.5	Selected Methods of Interpretation of the Observed Changes in Earth Orientation	357
7.5.1	Autoregressive (AR) Modeling	358
7.5.2	<i>Kalman</i> Filter with the AR Model of the Excitation Data	363
7.5.3	Maximum Entropy Method (MEM) of Spectral Estimation	372
7.6	Global Tidal Parameters and their Numerical Values	379
7.6.1	Introduction	379
7.6.2	Tidal Dissipation	381
7.6.3	Dynamic <i>Love</i> Numbers	381
7.6.4	Empirical Results	385
7.6.5	Ocean Tides	390

7.6.6	Additional Secular and Paleo-Effects	392
7.6.7	Outlook	394
7.7	On the Period and Damping of Polar Motion	407
7.7.1	The Influence of the Anelastic Properties of the Mantle on the Period and Damping of <i>Chandler</i> Wobble	407
7.7.2	The Dynamical Effects of Heterogeneous Compressible Liquid Core	413
7.7.3	The Statical and Dynamical Effects in the Oceans	421
7.7.3.1	A Spherical Harmonic Model of the Static Pole Tide	421
7.7.3.2	The Comparison with Observed Values	425
7.7.3.3	The Influence of the Static Pole Tide on the Earth's Rotation . . .	427
7.7.3.4	The Dynamical Effects in the Oceans	429
7.7.3.5	Discussion	435
7.7.3.6	The Simplest Numerical Estimations	437
7.7.4	Conclusions	439
8.	Variation of Earth's Rotation Speed in Geological Time-Scale.	
	The Tidal Friction	441
8.1	The Phenomenon of Tidal Friction	441
8.1.1	History of the Investigation of the Tidal friction	441
8.1.2	The Physical Backgrounds	442
8.2	Data Sources for the Study of the Long-Term Variations in Earth Rotation and in Development of the Earth-Moon System	444
8.2.1	Astronomical Evidences	444
8.2.2	Paleontological and Paleosedimental Data	444
8.2.3	Paleo-Cotidal Data	448
8.3	Law of Conservation of Angular Momentum in the Earth-Moon-Sun System	453
8.4	Determination the Tidal Torque L Exerted by Moon and Sun . . .	455
8.4.1	The Atmospheric Tidal Torque	456
8.4.2	Solid Earth's Tidal Torque	456
8.4.3	Oceanic Tidal Torque	457

8.4.4	Interpretation of Despinning and Tidal Torque Data	458
8.5	Remarks on the Energy Dissipation during the Geological History	461
8.6	Geodetic Consequences of the Tidal Despinning	463
8.7	Paleostress-Fields Due to the Changes of the Earth's Hydrostatic Figure throughout Geological Flattening	465
8.7.1	Description of the Stress Fields Due to the Geometrical Flattening	465
8.7.2	Geological and Seismological Evidences of the Global Stress Field Variations	467
8.8	Some Closing Remarks	471
