

Contents

1. Basic concepts	1
1.1. Introduction	1
1.2. Principles of ultrahigh vacuum technique	2
1.2.1. Why is UHV necessary?	2
1.2.2. Production of ultrahigh vacuum	3
1.2.3. Pressure measurements	3
1.2.4. Gas handling	4
1.3. Preparation of clean surfaces	4
1.4. Interactions of slow electrons with matter	7
1.5. Electron energy analyzers	9
1.5.1. Retarding field grid analyzer (RFA)	9
1.5.2. Cylindrical mirror analyzer (CMA)	12
1.5.3. 127° -analyzer	13
1.5.4. Concentric hemisphere analyzer (CHA)	14
1.6. References	15
2. Auger electron spectroscopy	17
2.1. Historical development	17
2.2. Experimental	18
2.2.1. The source of excitation	18
2.2.2. The sample	19
2.2.3. Analyzer and detector system	19
2.2.4. Further refinements	22
2.3. Mechanism of the Auger process	24
2.4. Energies and shapes of the Auger peaks	30
2.4.1. Free atoms	30
2.4.2. Condensed matter	30
2.4.3. Chemical effects	33
2.5. Intensity of the Auger electron emission	34
2.5.1. The Auger yield	34
2.5.2. The ionization cross section	36
2.5.3. Auger electron emission from condensed matter	37
2.6. The detected volume	39
2.7. Qualitative analysis	41
2.8. Quantitative analysis	41
2.8.1. Determination of relative surface quantities	41
2.8.2. Absolute surface quantities	42
2.8.3. Alloys	43
2.8.4. Depth profiling	45
2.8.5. Kinetic studies	46
2.9. Deconvolution technique and band structure	47
2.10. References	49

3. Electron Energy Loss Spectroscopy	53
3.1. General remarks	53
3.2. Experimental	54
3.3. Ionization spectroscopy	54
3.4. Plasmon losses	57
3.5. Inelastic low energy electron diffraction (ILEED)	60
3.6. Changes of energy-loss spectra by adsorbed layers	62
3.7. References	65
4. Photoelectron Spectroscopy	67
4.1. Introduction	67
4.2. Experimental	69
4.2.1. Light sources	69
4.2.2. Analyzer and detector	70
4.3. Photoelectron emission from solids	72
4.4. Band structure of metals and alloys	77
4.5. Metal surfaces and chemisorption levels	79
4.6. Semiconductors	82
4.7. References	83
5. Appearance Potential Spectroscopy (APS)	85
5.1. Introduction	85
5.2. Experimental	86
5.3. The mechanism of APS	88
5.4. Surface analysis	91
5.5. Energies of atomic core levels	91
5.6. Band structure of metals and alloys	93
5.7. Plasmon coupling	95
5.8. Chemical effects	96
5.9. References	97
6. Field Emission Spectroscopy	99
6.1. Introduction	99
6.2. Energy distribution of field emitted electrons from clean surfaces	100
6.3. Adsorbed layers and resonance tunneling	103
6.4. References	106
7. Ion Neutralization Spectroscopy	109
7.1. References	114
8. Work function and contact potential	115
8.1. Introduction	115
8.2. Experimental techniques	117
8.2.1. Thermionic electron emission	117
8.2.2. Photoemission	118
8.2.3. Field emission	118
8.2.4. Field emission retarding potential method (FERP)	119
8.2.5. Vibrating capacitor method (Kelvin method)	120
8.2.6. Diode method	121

8.3. The work function of clean surfaces	122
8.4. Adsorbed layers	123
8.5. References	126
9. Low energy electron diffraction (LEED)	129
9.1. Historical development	129
9.2. Classification of surface structures	130
9.3. Formation of the diffraction pattern	133
9.4. Experimental equipment	135
9.4.1. Introduction	135
9.4.2. Electron gun	135
9.4.3. Crystal manipulator	136
9.4.4. Detector system	137
9.5. Geometrical theory of diffraction	140
9.5.1. Introduction	140
9.5.2. The reciprocal lattice	141
9.5.3. Interference conditions and the Ewald construction	143
9.5.4. Analysis of a simple diffraction pattern	145
9.5.5. Domain structures	146
9.5.6. LEED pattern of coincidence lattices and incoherent structures	149
9.6. Kinematic theory	152
9.6.1. Introduction	152
9.6.2. Scattering at two-dimensional lattices	152
9.6.3. Kinematical structure factor	156
9.6.4. Intensity-voltage (I/U) curves	157
9.7. Disordered structures	159
9.7.1. Introduction	159
9.7.2. The diameter of the coherence zone	159
9.7.3. Size effects	160
9.7.4. Substitution disorder	161
9.8. Facets and stepped surfaces	166
9.8.1. Faceting	166
9.8.2. Surfaces with regular steps arrays	168
9.9. Simulation of diffraction patterns	170
9.10. Elements of a dynamic LEED theory	171
9.10.1. The need for a dynamic theory	171
9.10.2. Physical parameters entering a complete theory	173
9.10.3. Semi-empirical extensions of the kinematic theory	175
9.10.4. Multiple-scattering models	176
9.11. Averaging methods	179
9.12. Structural aspects of clean surfaces	182
9.12.1. Atomic distances in surface layers	182
9.12.2. Metals	183
9.12.3. Alloys	185
9.12.4. Semiconductors and semimetals	185
9.12.5. Ionic crystals and insulators	187
9.13. References	188

10. Vibrations at Surfaces	193
10.1. Introduction	193
10.2. The vibrating lattice/temperature effects in LEED	194
10.2.1. Variations of the LEED-intensities	194
10.2.2. Shifts of the Bragg maxima	201
10.2.3. Thermal diffuse scattering	202
10.3. High resolution energy loss spectroscopy	205
10.4. Infrared spectroscopy	207
10.5. References	208
11. Processes in adsorbed layers	211
11.1. Introduction	211
11.2. Reactions of electrons with adsorbed particles	213
11.3. Ordered adsorbed phases	216
11.4. Physical adsorption	220
11.5. Metallic adsorbates	221
11.6. Chemisorption of gases	225
11.7. Co-adsorption	230
11.8. Reactions at surfaces	232
11.9. References	236
