<b>1</b>	<b>Recent developments in radical polymerization</b>	<b>1</b>
	T. P. DAVIS and D. M. HADDLETON	
1.1	Introduction	1
1.2	Iniferters in radical polymerization	3
1.3	Use of nitroso compounds as modifiers in radical polymerization	4
1.3.1	General features	4
1.3.2	Alkoxyamine initiators as sources of nitroso radicals	6
1.3.3	Use of arenediazonium compounds	10
1.3.4	Use of stable nitroso radicals in conjunction with peroxides	12
1.3.5	Use of nitroso radicals in the presence of aluminium alkyls	14
1.3.6	Summary	17
1.4	Chain transfer polymerization	17
1.4.1	Introduction	17
1.4.2	Coenzyme B <sub>12</sub> chemistry	18
1.4.3	Chain transfer mechanism	19
1.4.4	Catalytic inhibition	26
1.4.5	CCT in copolymerization	26
1.4.6	Catalyst structures	27
1.4.7	Axial base ligands	28
1.4.8	Oligomer structure and synthesis	30
1.4.9	Applications of CCT polymerization	30
1.5	Related polymerization techniques	32
1.6	Conclusion	33
	References	34
<b>2</b>	<b>Precision polymer synthesis by living cationic polymerization</b>	<b>37</b>
	M. SAWAMOTO and M. KAMIGAITO	
2.1	Introduction	37
2.1.1	Background	37
2.1.2	Living cationic polymerization	37
2.1.3	Precision polymer synthesis: scope	40
2.2	Pendent-functionalized polymers	41
2.2.1	Vinyl ethers	41
2.2.2	Styrene derivatives	43
2.3	End-functionalized polymers	44
2.3.1	Vinyl ethers	45
2.3.2	Styrene derivatives	49
2.3.3	Isobutene	49
2.4	Macromonomers	50
2.5	Block polymers	52
2.5.1	Sequential living cationic polymerization	52
2.5.2	Transformation of mechanisms (method (6)-A-ii)	56
2.5.3	Polymer coupling	58
2.5.4	Living cationic polymerization from macroinitiator (method (7))	58
2.6	Multiarmed and macrocyclic polymers	59
2.6.1	Multiarmed polymers	59
2.6.2	Macrocyclic polymers	63
	References	64

<b>3</b>	<b>Recent advances in metathesis polymerisation</b>	<b>69</b>
	W. J. FEAST and E. KHOSRAVI	
3.1	Introduction	69
3.2	Well-defined initiators	69
3.3	Ring opening metathesis polymerisation (ROMP)	74
3.3.1	Synthesis of functional polymers	74
3.3.2	Aqueous ROMP	89
3.4	Combination of living ROMP with other polymerisation techniques	94
3.4.1	ROMP with aldol GTP	94
3.4.2	ROMP with anionic polymerisation	94
3.5	Ring closing olefin metathesis	98
3.6	Acyclic diene metathesis (ADMET): olefin metathesis in a step growth polymerisation	99
3.7	Materials via metathesis	101
3.7.1	Conducting polymers	101
3.7.2	New highly polar materials	106
3.7.3	Nanoscale clusters via microphase separated materials	107
3.7.4	Side chain liquid crystal polymers	108
3.7.5	Precursors to ceramics	111
	References	112
<b>4</b>	<b>Polymer synthesis using high intensity ultrasound</b>	<b>117</b>
	G. J. PRICE	
4.1	Introduction	117
4.1.1	Origin of sonochemical effects	118
4.1.2	Cavitation	118
4.1.3	Factors affecting cavitation	120
4.1.4	Consequences of cavitation	122
4.2	Experimental techniques in sonochemistry	123
4.3	Ultrasonic degradation of polymers in solution	125
4.3.1	Kinetics of degradation	125
4.3.2	Mechanism of degradation	128
4.3.3	Applications of ultrasonic degradation	129
4.3.4	Summary	132
4.4	Polymerization initiated by radicals	133
4.4.1	The initiation process	135
4.4.2	The polymerization process	139
4.4.3	Summary	142
4.5	Suspension and emulsion polymerization	143
4.6	Ring opening polymerizations	144
4.7	Condensation polymerizations	147
4.8	Electrochemically promoted polymerizations	147
4.9	Polymerization employing organometallic reagents	150
4.9.1	Ziegler-Natta polymerizations	150
4.9.2	Poly(organosilanes)	152
4.10	Conclusions and future prospects	155
	References	157
<b>5</b>	<b>Plasma polymerization and plasma modification of polymer surfaces</b>	<b>161</b>
	H. YASUDA	
5.1	Introduction	161
5.2	Domain of plasma polymerization and plasma surface modification	162

5.2.1	Comparison of vacuum deposition processes – chemical vapour deposition (CVD), plasma-assisted CVD and plasma polymerization	162
5.2.2	Plasma-induced polymerization	164
5.2.3	Plasma surface modification of polymers	165
5.2.4	Concept of ‘polymer’ in plasma polymerization	167
5.2.5	System dependency	167
5.2.6	Competitive ablation polymerization (CAP) principle	167
5.3	Fundamentals of plasmas	168
5.3.1	Types of plasmas	168
5.3.2	Distribution of energy and number of electrons	169
5.3.3	Excitation of organic molecules	173
5.3.4	Interaction of plasmas with surfaces	174
5.4	Ablation by plasmas	174
5.4.1	Chemical and physical etching of polymer surfaces	175
5.4.2	Influence of chemical structure of polymers	175
5.4.3	Influence of plasma gas	176
5.5	Plasma-state polymerization	177
5.5.1	Deposition rate	177
5.5.2	Mass balance in a plasma polymerization reactor	177
5.5.3	Growth mechanisms of plasma polymerization	179
5.5.4	Chemical structures of organic compounds for plasma polymerization	183
5.5.5	Dependence of properties of plasma polymers on chemical structure of monomer	184
5.5.6	Dependence of properties of plasma polymers on operational parameters	186
5.5.7	Dependence of properties of plasma polymers on substrate materials	187
5.6	Surface modification of polymers by non-polymer-forming plasmas	191
5.6.1	Plasma treatment of polymer surfaces	191
5.6.2	General principle (non-polymer-forming gases)	192
5.7	Post-plasma chemical reactions of trapped free radicals	193
5.8	General characteristics and significance of plasma polymers	193
	References	195
<b>6</b>	<b>Macrocycles for the synthesis of high molecular weight polymers</b>	<b>197</b>
	D. J. BRUNELLE	
6.1	Introduction	197
6.2	Cyclic polymers: formation	199
6.2.1	Kinetically controlled formation and thermodynamic ring opening	199
6.2.2	Ring opening polymerization	200
6.3	Cyclic aromatic carbonates	200
6.3.1	Background	200
6.3.2	Cyclic oligomeric carbonates	201
6.4	Macrocyclic esters	217
6.4.1	Macrocyclic arylates	217
6.4.2	Macrocyclic araliphatic esters	220
6.5	Macrocyclic ethers and ethersulfones, etherketones and etherimides	223
6.6	Macrocyclic aramids	229
6.7	Conclusion	233
	References	233
<b>7</b>	<b>Heterocyclic polymers with high glass transition temperatures</b>	<b>236</b>
	B. SILLION and G. RABILLOUD	
7.1	Introduction—general features	236

7.2	Soluble linear polymers	238
7.2.1	Polymers with flexible bonding groups	239
7.2.2	Polymers with side chain substituents	240
7.2.3	Cardo polyimides	243
7.2.4	Combined effects	244
7.2.5	Thermal rigidification	245
7.2.6	Transparent polymers	247
7.2.7	Soluble photosensitive polymers	251
7.2.8	Rod-like polymers	259
7.2.9	Liquid crystal heterocyclic polymers	265
7.2.10	Expanded linear heterocyclic polymers	266
7.3	Thermosetting heterocyclic polymers	268
7.3.1	Introduction	268
7.3.2	Bismaleimides	270
7.3.3	Norbornene-terminated polyimides (bisnadimides)	273
7.3.4	Ethynyl-terminated oligomers	275
7.3.5	Benzocyclobutene-terminated polymers	276
7.3.6	Bisphenol propargyl ethers and bischromenes	279
7.3.7	Miscellaneous end-capping groups	279
7.3.8	Organic-inorganic polymers (sol-gel process)	280

## **8 Three-dimensional dendritic macromolecules: design, synthesis and properties** **290**

C. J. HAWKER and J. M. J. FRÉCHET

8.1	Introduction	290
8.2	Synthesis	294
8.2.1	Divergent approach	295
8.2.2	Convergent approach	298
8.3	Characterization	302
8.4	Alternative dendritic syntheses and structures	306
8.5	Accelerated syntheses	310
8.6	Dendritic block copolymers	314
8.7	Physical properties	321
8.8	Conclusion	327
	Acknowledgments	327
	References	328
