Inverse problems in biomedical imaging: modeling and methods of solution

<i>M. Bertero, M. Piana</i>	1
1 Introduction	1
1.1 X-ray tomography	2
1.2 Fluorescence microscopy	5
2 Linearity	5
3 Ill-posed problems and uncertainty of solution	10
4 Noise modeling	14
4.1 Additive Gaussian noise	16
4.2 Poisson noise	16
5 The use of prior information	18
6 Computational issues and reconstruction methods	21
7 Perspectives	27
7.1 Electrical Impedance Tomography	27
7.2 Optical Tomography	28
7.3 Microwave Tomography	28
7.4 Magnetoencephalography	29

Stochastic geometry and related statistical problems in biomedicine

<i>V. Capasso, A. Micheletti</i>	35
1 Introduction	36
2 Elements of stochastic geometry	41
2.1 Stochastic geometric measures	48
3 Hazard function	50
4 Mean densities of stochastic tessellations	51
5 Interaction with an underlying field	53
6 Fibre and surface processes	55
6.1 Planar fibre processes	56
7 Estimate of the mean density of length of planar fibre processes	58
7.1 Local mean density of length and the spherical contact distribution function	59
7.2 Estimate of the local mean density of length	60
7.3 Numerical results	61
7.4 Applications	63

Mathematical modelling of tumour growth and treatment

<i>A. Fasano, A. Bertuzzi, A. Gandolfi</i>	71
1 Introduction	71
1.1 Why	71
1.2 How	72
1.3 What	73
2 Models including the analysis of stresses	74
2.1 Applying the mechanics of mixtures to tumour growth: the “two-fluid” approach	75
2.2 Vascular tumours: models for vascular collapse	78
3 About tumour morphology and asymptotic behaviour	80
3.1 Radially symmetric solutions and their stability under radially symmetric perturbations	80
3.2 Looking for non-radially symmetric stationary solutions	81
3.3 The general problem of the stability of radially symmetric solutions	83
3.4 Asymptotic regimes and vascularisation	84
4 Models with cell age or cell maturity structure for tumour cords	85
4.1 Tumour cords	85
4.2 Age and maturity structured models	86
5 A tumour cord model including interstitial fluid flow	90
5.1 Cell populations and cord radius	91
5.2 Extracellular fluid flow and the necrotic region	93
6 Modelling tumour treatment	97
6.1 Spherical tumours	97
6.2 Tumour cords	98
6.3 Hyperthermia treatment with geometric model of the patient	103
7 Conclusions and perspectives	104

Modelling the formation of capillaries

<i>L. Preziosi, S. Astanin</i>	109
1 Vasculogenesis and angiogenesis	109
2 In vitro vasculogenesis	111
3 Modelling vasculogenesis	116
3.1 Diffusion equations for chemical factors	117
3.2 Persistence equation for the endothelial cells	119
3.3 Substratum equation	120
4 In silico vasculogenesis	121
4.1 Neglecting substratum interactions	122
4.2 Substratum interactions	127
4.3 Exogenous control of vascular network formation	130
5 An angiogenesis model	133
6 Future perspectives	137

Numerical methods for delay models in biomathematics

<i>A. Bellen, N. Guglielmi, S. Maset</i>	147
1 Introduction	147
2 Solving RFDEs by continuous Runge-Kutta methods	151
2.1 Continuous Runge-Kutta (standard approach) and functional continuous Runge-Kutta methods	152
3 A threshold model for antibody production: the Waltman model	154
3.1 The quantitative model	155
3.2 The integration process	159
3.3 Tracking the breaking points	161
3.4 Solving the Runge–Kutta equations	164
3.5 Local error estimation and stepsize control	169
3.6 Numerical illustration for the Waltman problem	170
3.7 Software	172
4 The functional continuous Runge-Kutta method	172
4.1 Order conditions	176
4.2 Explicit methods	177
4.3 The quadrature problem	182

Computational electrocardiology: mathematical and numerical modeling

<i>P. Colli Franzone, L.F. Pavarino, G. Savaré</i>	187
1 Introduction	187
2 Mathematical models of the bioelectric activity at cellular level	189
2.1 Ionic current membrane models	189
2.2 Mathematical models of cardiac cell arrangements	192
2.3 Formal two-scale homogenization	196
2.4 Theoretical results for the cellular and averaged models	199
2.5 Γ -convergence result for the averaged model with FHN dynamics	201
2.6 Semidiscrete approximation of the bidomain model with FHN dynamics	203
3 The anisotropic bidomain model	205
3.1 Boundary integral formulation for ECG simulations	208
4 Approximate modeling of cardiac bioelectric activity by reduced models	211
4.1 Linear anisotropic monodomain model	211
4.2 Eikonal models	213
4.3 Relaxed nonlinear anisotropic monodomain model	216
5 Discretization and numerical methods	218
5.1 Numerical approximation of the Eikonal–Diffusion equation	218
5.2 Numerical approximations of the monodomain and bidomain models	219
6 Numerical simulations	223
7 Conclusions	230

The circulatory system: from case studies to mathematical modeling

<i>L. Formaggia, A. Quarteroni, A. Veneziani</i>	243
1 An overview of vascular dynamics and its mathematical features	243
2 Case studies	247
2.1 Numerical investigation of arterial pulmonary banding	247
2.2 Numerical investigation of systemic dynamics	253
2.3 The design of drug-eluting stents	261
2.4 Pulmonary and systemic circulation in individuals with congenital heart defects	267
2.5 Peritoneal dialysis optimization	271
2.6 Anastomosis shape optimization	277
3 A wider perspective	281
Index	289
