

CONTENTS

PREFACE	VII
CHAPTER 1. INTRODUCTION	1
Composition of argillaceous sediments	2
Some fundamental fluid mechanics concepts	4
Fundamental equation of fluid statics	4
Buoyancy	5
Mechanics of compaction	6
Laboratory and field data on compaction	12
Diagenesis–metamorphism transition phase	15
Properties of argillaceous sediments as related to compaction	17
Interstitial fluids	17
Experimental data on the chemistry of solutions expelled due to compaction	19
Subsidence	22
Abnormal fluid pressures	23
References	27
CHAPTER 2. INTERRELATIONSHIPS AMONG DENSITY, POROSITY, REMAINING MOIS- TURE CONTENT, PRESSURE AND DEPTH	31
Introduction	31
Density–depth–pressure relationships	31
Density variations of recent sediments and shales with depth	35
Porosity–density relationship	39
Porosity–depth relationships	41
Porosity variations with depth	41
Effect of carbonate content on porosity	50
Experimental compaction of recent sediments, muds and clays	52
Nature and degree of hydration of clays, gums and silicic acid	52
Hydration of clays	53
Hydration of silicic acid	56
Relationship between residual moisture content and pressure	57
Relationship between pressure and porosity of carbonate sediments	66
Moisture content versus time relationship	70
Calculation of compaction parameters	74
Effect of various electrolytes in interstitial water on compaction	77
References	83
CHAPTER 3. MECHANICS OF COMPACTION AND COMPACTION MODELS	87
Introduction	87
Theory of consolidation	87
State of stress in compacting shales	92
Resolution of the total stress field	94
Hydrostatic stress state, 95 – Deviatoric stress state, 96 – Total stress tensor, 97	
Variation of the overburden stress	98
Evaluation of the shear stresses due to an overburden load, 99	
Estimation of the magnitude and direction of stress	101

Pressure–depth–density relationships	103
Porosity–depth compaction models	106
Athy's compaction model, 107 – Hedberg's compaction model, 107 – Weller's compaction model, 107 – Power's compaction model, 109 – Teodorovich and Chernov's compaction model, 112 – Burst's compaction model, 112 – Beall's compaction model, 113	
Differential compaction	115
Estimation of maximum effective pressure that has ever existed in an argillaceous sediment	118
References	120
 CHAPTER 4. EFFECT OF COMPACTION ON SOME PROPERTIES OF ARGILLACEOUS SEDIMENTS	
Introduction	123
Pore-size distribution in clays	124
Microstructural changes in argillaceous sediments undergoing compaction	127
X-ray diffraction techniques used in compaction studies	131
Crystal structural changes in clay minerals at different temperatures and at elevated pressures	133
Dickite (API no. 15), 134 – Halloysite (API no. 12), 134 – Hectorite (Stevensite) (API no. 34), 135 – Montmorillonite, 137 – Silica, 138	
Permeability	140
Specific storage	144
Permeability of compacted clays	144
Relationship between permeability and porosity	148
Rheology of argillaceous sediments	153
Rheological models	154
Elastic and strength properties of argillaceous sediments	158
Elastic properties of unconsolidated and indurated sediments	158
Elastic moduli, 161 – Modulus of elasticity (Young's modulus), 162 – Bulk modulus, 166 – Rigidity, 167 – Poisson's ratio, 167 – Lamé constant, 168 – Effect of pore fluids on elastic properties, 168	
Strength properties of argillaceous sediments	168
Shear strength, 169 – Compressive strength, 169	
Relationship between strength and texture (orientation) of clays	172
Compressibility of argillaceous sediments	173
Relationships among remaining moisture content, void ratio and compressibility	174
Experimental data on compressibility	179
Compressibility of dry clays, 187	
Comparison among compressibilities of dry and hydrated clays and sands	194
Effect of temperature on compressibility	198
Creep	198
Finite strain, 200	
Changes in compression index with compaction	201
Coefficient of consolidation	205
Variation of physical properties with depth in recent sediments of York River, southeastern Virginia, U.S.A. (a case study)	205
References	210
 CHAPTER 5. CHEMICAL ALTERATIONS AND BEHAVIOR OF INTERSTITIAL FLUIDS DURING COMPACTION	
Introduction	219
Classification of interstitial solutions	220
Composition of interstitial solutions related to that of sea water	221
Solubility and mobility of various salts and ions	223

Brief review of various processes affecting chemical composition of interstitial waters	225
Clay particle–fluid interface	227
Double-layer theory	229
Helmholtz double-layer model (rigid double layer), 229 – Gouy double-layer model (diffuse double layer), 229 – Stern double layer model (combination double layer), 231	
Electrodiagenesis	231
Role of gravity and temperature gradients in formation of fossil brines	232
Fluid release mechanisms	232
Semipermeable membrane, osmosis, and reverse osmosis	233
Electrochemistry of semipermeable clay membranes, 234	
Diagenetic clay mineral alteration	238
Chemical cementation	239
Effect of compaction on the chemistry of solutions squeezed out of clays and muds – experimental data and theoretical analysis	239
Brief review of diagenetic changes of pore waters	258
Early diagenetic changes of pore waters	258
Late diagenetic changes in sediments	260
Some chemical changes involving silicates	261
Some variations in Ca/Mg ratio of interstitial waters	262
Influence of microorganisms on the chemical composition of underground waters	263
Hydrochemical facies and vertical variation in chemistry of interstitial fluids	264
Salinity distribution in sandstones and associated shales	270
Squeezing of oil and bitumens out of muds and shales	272
Compaction as a possible cause of primary migration of oil	273
Temperature gradient as a driving force for migration of petroleum	274
Chemistry of oil-field water dissolved in crude oil	275
Relationship of trace elements in crude oil and associated shales	275
References	276
CHAPTER 6. SUBSIDENCE	283
Introduction	283
Origin of sedimentary basins and geosynclines	284
Hydrogeological cycle	290
Subsidence as a result of fluid withdrawal	291
Near-surface subsidence	296
Mathematical analyses of subsidence	296
Jacquin–Poulet computer model	297
Depth–time relationship, 300 – Flow of water in clay, 300	
References	303
CHAPTER 7. ABNORMAL GEOPRESSURES	305
Introduction	305
Origin of abnormal geopressures	309
Compaction as a cause of abnormal formation pressures	311
Rapid loading and continuous sedimentation, 312	
Faulting as a cause of overpressured formations	320
Phase changes in minerals during compaction	322
Gypsum–anhydrite conversion, 322 – Clay-mineral dehydration and transformation, 324 – Clay-mineral diagenesis, 326 – Creation and maintenance of abnormal pressures, 330	
Salt and shale diapirism	334
Tectonic compression	335
Osmotic and diffusion pressures	337
Geothermal temperature changes	339

Anatomy of an abnormal fluid pressure zone	343
Calculation of abnormal pressures from well logs	346
References	348
CHAPTER 8. EQUIPMENT AND TECHNIQUES USED IN COMPACTION STUDIES	353
Development of compaction equipment	353
Compaction studies prior to 1930	353
Development of equipment after 1930	357
Classification of compaction equipment	363
Consolidometers	365
Filter presses	370
Linear piston apparatuses	372
High-pressure dual-piston compaction apparatuses, 379	
Triaxial and hydrostatic compaction apparatuses	382
Some salient features of calibrating uniaxial compaction apparatuses	387
Calibration of high-pressure linear piston devices	388
Calibration of very-high-pressure apparatuses	393
References	395
APPENDIX A. CONVERSION FACTORS	399
REFERENCES INDEX	403
SUBJECT INDEX	411
