Preface	V
Further Reading	VI
Chapter 1. Sedimentation and environment	
1.1 Introduction	1
1.2 The relationship between observed rocks and the sedimentary environment	2
1.3 The environment	4
1.4 The environmental model	5
1.5 Organization of the environment	7
1.6 The classification of sedimentary environments	9
1.7 Sedimentation processes	10
1.8 Observation and interpretation	13
1.9 Conclusions	16
Chapter 2. Sediment and time	
2.1 Introduction	17
2.2 The principle of superposition	18
2.3 Sedimentary bedding	20
2.4 Rates of sedimentation	25
2.5 Stratigraphical units and time	31
2.6 Time and the sedimentary environment	32
2.7 Summary	35
Chapter 3. Deterministic models	
3.1 Introduction	37
3.2 Deterministic and stochastic models	37
3.3 The use of models in stratigraphic analysis	39
3.4 Theoretical versus empirical models	40
3.5 The optimization of models	41
3.6 The evaluation of models	44
3.7 Erosion and deposition models	45
3.8 Sedimentation in subsiding basins	51
3.9 Sedimentation rates and basin control	55
Chapter 4. Stochastic models	
4.1 Introduction	61
4.2 The basic elements of probability theory	63
4.3 The simple random walk	66
4.4 The random walk as a model of bed formation	71
4.5 The Kolmogorov model of bed formation	72
4.6 The Poisson process	75
4.7 Other continuous distributions	80
4.8 Continuous variable models and queues	84
4.9 The use of stochastic models in stratigraphy	86

Chapter 5. Markov chains	
5.1	Introduction 91
5.2	The Markov process 92
5.3	The n -step transition probability 95
5.4	Recurrence and classification of states 98
5.5	The eigenvalues of a Markov matrix 102
5.6	Higher-order chains 105
5.7	The estimation of transition probability matrices and tests for the Markov property 106
5.8	Structuring stratigraphic sections for a Markov-chain model 111
5.9	Structuring by the equal-interval method 113
5.10	Structuring by lithological states 116
5.11	The Markov property and sedimentation 119
Chapter 6. Renewal processes and semi-Markov processes	
6.1	Introduction 123
6.2	Renewal processes 124
6.3	Sedimentation as a renewal process 128
6.4	The thickness distributions of beds representing equal time intervals 132
6.5	The thickness distribution of sedimentary beds 137
6.6	Semi-Markov chains 142
6.7	The semi-Markov chain as a stratigraphic model 148
6.8	The analysis of sections in terms of the semi-Markov model 151
6.9	Sedimentation—erosion processes 158
6.10	Concluding remarks 159
Chapter 7. Stationary stochastic processes and time-series analysis	
7.1	Introduction 161
7.2	The description of random variables 162
7.3	Simple stationary time processes 167
7.4	Autoregressive processes 169
7.5	Oscillating and cyclical sedimentation models 176
7.6	The estimation and testing of correlograms 179
7.7	The interpretation of empirical correlograms 185
7.8	Multiple time-series analysis 187
Chapter 8. The spectral analysis of geological data	
8.1	Introduction 191
8.2	The periodogram 193
8.3	The spectral analysis of random processes 195
8.4	Examples of spectral distributions and linear operations on processes 200
8.5	The estimation of the power spectrum 204
8.6	The geological applications of spectral analysis 207
8.7	Fitting models to observed power spectra 213
8.8	The spectral analysis of multiple time series 217
Chapter 9. The analysis of stratigraphical trends and the smoothing of data	
9.1	Introduction 223
9.2	Tests for stationarity and trend 224
9.3	The fitting of a trend by regression methods 225
9.4	Trend fitting by filters 227
9.5	Trend removal 229
9.6	Smoothing procedures 233

9.7	Some geological considerations regarding stratigraphic trend	236
9.8	Some simple models for sedimentary trend	238
9.9	The recognition of sedimentary trends	243
9.10	The removal of stratigraphical trends	247
9.11	The potentialities of stochastic trends	249
Chapter 10. Sedimentary cycles		
10.1	Introduction	253
10.2	Sedimentary cycles in stratigraphy	253
10.3	Sequential cycles	256
10.4	Sequential cycles in practical stratigraphy	261
10.5	The modal cycle and similar concepts	264
10.6	The cyclicity of environmental events	268
10.7	Geometrical and time cyclicity	274
10.8	The analysis of geometrical cycles	275
10.9	Concluding remarks	280
Chapter 11. Sedimentary cycles and time		
11.1	Introduction	283
11.2	The stratigraphic time scale	284
11.3	Sander's rule of rhythmic records	288
11.4	The sedimentation—time relationship of random models	290
11.5	The application of model analysis to practical examples	296
11.6	The number of beds in a sedimentary cycle	300
11.7	Composite cycles	305
11.8	The causes of sedimentary cycles	309
11.8.1	The reconstruction of the environmental history of a cycle	309
11.8.2	Cyclicity (as discussed in Chapter 10)	310
11.8.3	Problems arising from composite cycles	310
11.8.4	The time duration of a sedimentary cycle	311
11.8.5	The persistency of sedimentary cycles in space and time	314
11.9	Some remarks on tectonic cycles	315
11.10	Concluding remarks	319
Chapter 12. Stratigraphical correlation		
12.1	Introduction	321
12.2	The correlation of lithostratigraphic units	322
12.3	Quantitative approaches to lithostratigraphic matching and correlation	326
12.4	Further problems of quantitative correlation	334
12.5	The correlation of sections with different vertical scales	339
12.6	Stratigraphic time correlations	343
Chapter 13. Some problems of three-dimensional stratigraphic analysis		
13.1	Introduction	349
13.2	The areal variation of sediments	350
13.3	The estimation of areal trend	352
13.4	Stationary random processes in the areal distribution	354
13.5	The lithological variation in stratigraphic profiles	358
13.6	Models for simulating geological profiles	363
13.7	The environmental model	368
