Preface	xii
1. Introduction	1
1.1 Finite Element Methods	1
1.2 Capabilities of FEA	1
1.3 Outline of Finite Element Procedures	5
1.4 Optimization Concepts	9
1.5 References	14
2. Mathematical Preliminaries	15
2.1 Introduction	15
2.2 Linear Spaces and Norms	17
2.3 Sobolev Norms*	19
2.4 Self-Adjointness*	19
2.5 Weighted Residuals	20
2.6 Essential Boundary Conditions	27
2.7 Elliptic Boundary Value Problems	28
2.7.1 One-Dimensional Equations	28
2.7.2 Two-Dimensional Equations	31
2.7.3 Equivalent Forms*	34
2.8 References	37
3. Variational Methods	38
3.1 Introduction	38
3.2 Structural Mechanics	38
3.3 Finite Element Analysis	40
3.4 Continuous Elastic Bar	46
3.5 Flux Recovery for an Element	52
3.6 Thermal Loads on a Bar*	54
3.7 Heat Transfer in a Rod	55
3.8 Gradient Estimates	57
3.9 Element Validation*	62

3.10	Element Distortion*	65
3.11	Euler's Equations of Variational Calculus*	67
3.12	System Validation*	69
3.13	References	71
4.	Element Interpolation and Local Coordinates	72
4.1	Introduction	72
4.2	Linear Interpolation	72
4.3	Quadratic Interpolation	75
4.4	Lagrange Interpolation	77
4.5	Hermitian Interpolation	78
4.6	Hierarchical Interpolation	79
4.7	Interpolation Error*	86
4.8	References	87
5.	One-Dimensional Integration	88
5.1	Introduction	88
5.2	Local Coordinate Jacobian	88
5.3	Exact Polynomial Integration*	89
5.4	Numerical Integration	90
5.5	Variable Jacobians	95
5.6	References	97
6.	Beam Analysis	98
6.1	Introduction	98
6.2	Variational Procedure	99
6.3	Hermite Element Matrices	101
6.4	Sample Application	104
6.5	Gradient Estimates*	106
6.6	Element Equations via Galerkin's Method*	108
6.7	Beams on an Elastic Foundation*	108
6.7.1	Foundation Models	109
6.7.2	Element Stiffness Matrices	110
6.7.3	Cubic Beam Elements	110
6.7.4	Fifth Order Beam Element	111
6.7.5	Member and Foundation Reaction Recovery	111
6.7.6	The Treatment for Gaps	112
6.7.7	Numerical Example	113
6.8	Exact Analytic Elements*	114
6.9	References	117
7.	Truss Elements and Axis Transformations*	118
7.1	Introduction	118
7.2	Direction Cosines	118

7.3	Transformation of Displacement Components	119
7.4	Transformation of Element Matrices	120
7.5	Example Structures	122
7.6	References	125
8.	Cylindrical Analysis Problems	126
8.1	Introduction	126
8.2	Heat Conduction in a Cylinder	126
8.3	Cylindrical Stress Analysis	129
8.4	References	132
9.	General Interpolation	133
9.1	Introduction	133
9.2	Unit Coordinate Interpolation	133
9.3	Natural Coordinates	140
9.4	Isoparametric and Subparametric Elements	140
9.5	Hierarchical Interpolation	151
9.6	Differential Geometry *	156
9.7	Parametric Extrapolation *	161
9.8	Mass Properties, Equivalent Geometry *	163
9.9	Interpolation Error *	165
9.10	References	167
10.	Adaptive Analysis	168
10.1	Introduction	168
10.2	H-Adaptivity	172
10.3	P-Adaptivity	175
10.4	HP-Adaptivity	176
10.5	Adaptive Example	181
10.6	References	189
11.	Integration Methods	190
11.1	Introduction	190
11.2	Unit Coordinate Integration	191
11.3	Simplex Coordinate Integration	192
11.4	Numerical Integration	195
	11.4.1 Unit Coordinate Quadrature	195
	11.4.2 Natural Coordinate Quadrature	196
11.5	Typical Source Distribution Integrals *	198
11.6	Minimal, Optimal, Reduced and Selected Integration *	201
11.7	References	206
12.	Heat Transfer	208
12.1	Introduction	208
12.2	Variational Formulation	208

12.3	Element and Boundary Matrices	210
12.3.1	Linear Triangle	211
12.3.2	Rectangular Bilinear Element *	212
12.3.3	General Elements	215
12.4	Example Application	215
12.5	References	218
13.	Elasticity	219
13.1	Introduction	219
13.2	Minimum Total Potential Energy	221
13.2.1	Displacement Interpolations	221
13.2.2	Strain-Displacement Relations	222
13.2.3	Stress-Strain Law	223
13.3	Matrices for the Constant Strain Triangle	224
13.4	Stress and Strain Transformations *	233
13.5	Anisotropic Materials *	236
13.6	Axisymmetric Solids *	238
13.7	General Solids *	240
13.8	References	241
14.	Error Measures for Elliptic Problems	242
14.1	Introduction	242
14.2	Error Estimates	245
14.3	Adaptive Process	251
14.4	Hierarchical Error Indicator	254
14.5	Example Error Calculations *	255
14.6	Flux Balancing Methods	259
14.7	References	261
15.	Sensitivity Analysis *	263
15.1	Introduction	263
15.2	Structural Models	263
15.3	Optimal Design Problem	265
15.4	Sensitivity Relations	265
15.5	Yield Criteria Sensitivity	267
15.6	Computing Stiffness Sensitivity	270
15.6.1	Exact Sensitivity	270
15.6.2	Finite Difference Approximations	271
15.7	Isoparametric Elements	272
15.8	Shape Sensitivity	273
15.9	References	276
16.	Special Elements *	277
16.1	Introduction	277

16.2	Interpolation Enhancement for C^0 Transition Elements	277
16.3	Singularity Elements	280
16.4	Semi-infinite Elements	285
16.5	Upwind Elements	286
16.6	Gap-Contact Elements	287
16.7	References	288
17.	Time-Dependent Problems	290
17.1	Introduction	290
17.2	Parabolic Equations	290
	17.2.1 Simple Approximations	292
	17.2.2 Examples	296
17.3	Hyperbolic Equations	297
	17.3.1 Simple Approximations	299
	17.3.2 Lumped Mass Forced Vibration Example	304
17.4	Diagonal "Mass" Matrices*	304
17.5	Units Diagonal Scaling*	309
17.6	References	312
18.	Computational Fluid Dynamics* with Dr. Bala Ramaswamy	313
18.1	Introduction	313
18.2	Mathematical Formulation	314
18.3	Solution Procedure Outline	315
18.4	Algorithm Details	318
18.5	Examples	330
	18.5.1 Lid-Driven Cavity Problem	330
	18.5.2 Sudden Expansion Problem	334
18.6	References	340
19.	Automatic Mesh Generation	342
19.1	Introduction	342
19.2	Automatic Mesh Generation	342
19.3	Tree Structure Methods	343
19.4	Mapping Methods*	350
	19.4.1 Mapping Functions	350
	19.4.2 Higher Order Elements	353
	19.4.3 MESH2D Program	354
19.5	References	358
20.	Computational Procedures	359
20.1	Introduction	359
20.2	Element Calculations	369
20.3	Condensation of Internal Degrees of Freedom*	383
20.4	Assembly into the System	387

20.4.1	Introduction	387
20.4.2	Assembly Programs	389
20.4.3	Example	395
20.5	Essential Boundary Conditions and Constraints	400
20.5.1	Application of Essential Boundary Conditions	400
20.5.2	Matrix Manipulations	401
20.5.3	Constraints Applied at the Element Level *	405
20.5.4	Penalty Modifications for Nodal Constraints *	405
20.6	Economical Solution of the System Equations	406
20.6.1	Efficient Node Numbering	407
20.6.2	Equation Solving Techniques	408
20.6.3	Programming the Solution	412
20.7	Frontal Assembly and Solution Procedures *	414
20.8	Iterative Solvers *	417
20.9	Programming Parametric Elements	419
20.10	Output of Results	421
20.11	Post-solution Calculations Within the Elements	424
20.12	Sample Graphical Outputs	429
20.13	References	429
21.	MODEL Applications in 1-D	431
21.1	Introduction	431
21.2	Conductive and Convective Heat Transfer	431
21.3	Plane Truss Structures *	437
21.4	Slider Bearing Lubrication	444
21.5	Ordinary Differential Equations *	449
21.5.1	Linear Example	449
21.5.2	Nonlinear Example	449
21.6	Plane Frame Structures	453
21.7	References	460
22.	MODEL Applications in 2- and 3-D	461
22.1	Introduction	461
22.2	Plane Stress Analysis	461
22.3	Heat Conduction	471
22.4	Viscous Flow in Straight Ducts	477
22.5	Potential Flow	480
22.6	Electromagnetic Waveguides *	492
22.7	Axisymmetric Plasma Equilibria *	494
22.8	Neutron Diffusion *	498
22.9	Axisymmetric Solenoid Magnet *	501
22.10	Three-Dimensional Applications	507
22.11	References	513

Appendices:

I.	Matrix Notation and Operations	515
II.	Subroutines in MODEL library	523
III.	Notation in MODEL	528
IV.	Program Disk Directory	531
INDEX	542

* Denotes sections or chapters that can be omitted for a first reading or shorter course.
