

Table of contents

Preface	
Introduction	
Some ecological notions	
1 Models of single-species communities	1
1.1 Population dynamics	1
1.2 Continuous models of a single-species community and the stability of its stationary states	2
1.3 The age structure of the population in continuous models	11
1.4 Connections between the population dynamics and the genetic structure of the population	24
1.5 Influence of the environment on the population density	33
1.6 Discrete models for a single population	37
1.7 Cycles and chaos in the solutions of a difference equation	43
1.8 Discrete model of the age structure of the population — Leslie equation	47
1.9 Small random perturbations of the population dynamics equation	53
1.10 Stochastic population dynamics	57
1.11 Instead of further models	61

2 Two-species communities	65
2.1 Interspecies interactions	65
2.2 Continuous models of predator–prey communities	66
2.3 Delay in predator–prey community models	88
2.4 Discrete models of the predator–prey community	97
2.5 Predator–prey community in natural environment	103
2.6 Travelling waves in the predator–prey model	106
2.7 Competition models	111
3 n-Species communities	119
3.1 Trophic nets	119
3.2 Classical Volterra models	120
3.3 Other notions of stability	132
3.4 Population dynamics and game theory	137
3.5 Stability and complexity	141
4 From determinism to randomness	144
4.1 Randomness in models of communities	144
4.2 Chaos and its deterministic description	146
4.3 Probabilistic description of chaos	160
4.4 Small random perturbations	171
References	176
