

Detailed Contents

Chapter 1 Introduction to Cells	1
UNITY AND DIVERSITY OF CELLS	2
Cells Vary Enormously in Appearance and Function	2
Living Cells All Have a Similar Basic Chemistry	3
All Present-Day Cells Have Apparently Evolved from the Same Ancestor	5
Genes Provide the Instructions for Cellular Form, Function, and Complex Behavior	5
CELLS UNDER THE MICROSCOPE	6
The Invention of the Light Microscope Led to the Discovery of Cells	6
Cells, Organelles, and Even Molecules Can Be Seen Under the Microscope	7
THE PROCARYOTIC CELL	11
Procaryotes Are the Most Diverse of Cells	14
The World of Procaryotes Is Divided into Two Domains: Bacteria and Archaea	15
THE EUKARYOTIC CELL	16
The Nucleus Is the Information Store of the Cell	16
Mitochondria Generate Usable Energy from Food to Power the Cell	17
Chloroplasts Capture Energy from Sunlight	18
Internal Membranes Create Intracellular Compartments with Different Functions	19
The Cytosol Is a Concentrated Aqueous Gel of Large and Small Molecules	21
The Cytoskeleton Is Responsible for Directed Cell Movements	22
The Cytoplasm Is Far from Static	23
Eukaryotic Cells May Have Originated as Predators	23
MODEL ORGANISMS	26
Molecular Biologists Have Focused on <i>E. coli</i>	27
Brewer's Yeast Is a Simple Eukaryotic Cell	28

<i>Arabidopsis</i> Has Been Chosen Out of 300,000 Species as a Model Plant	28
The World of Animals Is Represented by a Fly, a Worm, a Fish, a Mouse, and the Human Species	29
Comparing Genome Sequences Reveals Life's Common Heritage	33
Essential Concepts	35
End-of-Chapter Questions	36
Chapter 2 Chemical Components of Cells	39
CHEMICAL BONDS	40
Cells Are Made of Relatively Few Types of Atoms	40
The Outermost Electrons Determine How Atoms Interact	41
Ionic Bonds Form by the Gain and Loss of Electrons	44
Covalent Bonds Form by the Sharing of Electrons	45
Covalent Bonds Vary in Strength	46
There Are Different Types of Covalent Bonds	47
Electrostatic Attractions Help Bring Molecules Together in Cells	47
Water Is Held Together by Hydrogen Bonds	48
Some Polar Molecules Form Acids and Bases in Water	49
MOLECULES IN CELLS	50
A Cell Is Formed from Carbon Compounds	50
Cells Contain Four Major Families of Small Organic Molecules	51
Sugars Are Energy Sources for Cells and Subunits of Polysaccharides	52
Fatty Acids Are Components of Cell Membranes	54
Amino Acids Are the Subunits of Proteins	55
Nucleotides Are the Subunits of DNA and RNA	56

MACROMOLECULES IN CELLS	58
Macromolecules Contain a Specific Sequence of Subunits	59
Noncovalent Bonds Specify the Precise Shape of a Macromolecule	59
Noncovalent Bonds Allow a Macromolecule to Bind Other Selected Molecules	63
Essential Concepts	78
End-of-Chapter Questions	79
Chapter 3 Energy, Catalysis, and Biosynthesis	81
THE USE OF ENERGY BY CELLS	82
Biological Order Is Made Possible by the Release of Heat Energy from Cells	82
Photosynthetic Organisms Use Sunlight to Synthesize Organic Molecules	84
Cells Obtain Energy by the Oxidation of Organic Molecules	86
Oxidation and Reduction Involve Electron Transfers	87
FREE ENERGY AND CATALYSIS	88
Enzymes Lower the Energy Barriers That Prevent Chemical Reactions from Occurring	89
The Free-Energy Change for a Reaction Determines Whether It Can Occur	91
The Concentration of Reactants Influences the Free-Energy Change and a Reaction's Direction	92
The Standard Free-Energy Change Makes it Possible to Compare the Energetics of Different Reactions	92
Cells Exist in a State of Chemical Disequilibrium	92
The Equilibrium Constant is Directly Proportional to ΔG°	93
In Complex Reactions, the Equilibrium Constant Depends on the Concentrations of All Reactants and Products	96
The Equilibrium Constant Indicates the Strength of Molecular Interactions	96
For Sequential Reactions, the Changes in Free Energy are Additive	97
Rapid Diffusion Allows Enzymes to Find Their Substrates	98
V_{\max} and K_M Measure Enzyme Performance	99
ACTIVATED CARRIER MOLECULES AND BIOSYNTHESIS	104
The Formation of an Activated Carrier Is Coupled to an Energetically Favorable Reaction	104
ATP is the Most Widely Used Activated Carrier Molecule	105
Energy Stored in ATP is Often Harnessed to Join Two Molecules Together	106

NADH and NADPH Are Important Electron Carriers	107
Cells Make Use of Many Other Activated Carrier Molecules	109
The Synthesis of Biological Polymers Requires an Energy Input	110
Essential Concepts	114
End-of-Chapter Questions	115

Chapter 4 Protein Structure and Function **119**

THE SHAPE AND STRUCTURE OF PROTEINS 121

The Shape of a Protein Is Specified by Its Amino Acid Sequence 121

Proteins Fold into a Conformation of Lowest Energy 124

Proteins Come in a Wide Variety of Complicated Shapes 125

The α Helix and the β Sheet Are Common Folding Patterns 127

Helices Form Readily in Biological Structures 131

β Sheets Form Rigid Structures at the Core of Many Proteins 132

Proteins Have Several Levels of Organization 133

Few of the Many Possible Polypeptide Chains Will Be Useful 134

Proteins Can Be Classified into Families 135

Large Protein Molecules Often Contain More Than One Polypeptide Chain 135

Proteins Can Assemble into Filaments, Sheets, or Spheres 136

Some Types of Proteins Have Elongated Fibrous Shapes 138

Extracellular Proteins Are Often Stabilized by Covalent Cross-Linkages 138

HOW PROTEINS WORK 140

All Proteins Bind to Other Molecules 140

The Binding Sites of Antibodies Are Especially Versatile 142

Enzymes Are Powerful and Highly Specific Catalysts 143

Lysozyme Illustrates How an Enzyme Works 143

Most Drugs Inhibit Enzymes 148

Tightly Bound Small Molecules Add Extra Functions to Proteins 148

HOW PROTEINS ARE CONTROLLED 149

The Catalytic Activities of Enzymes Are Often Regulated by Other Molecules 150

Allosteric Enzymes Have Binding Sites That Influence One Another 150

Phosphorylation Can Control Protein Activity by Triggering a Conformational Change 152

GTP-Binding Proteins Are Also Regulated by the Cyclic Gain and Loss of a Phosphate Group	153
Nucleotide Hydrolysis Allows Motor Proteins to Produce Large Movements in Cells	154
Proteins Often Form Large Complexes That Function as Protein Machines	155
Covalent Modification Controls the Location and Assembly of Protein Machines	156
HOW PROTEINS ARE STUDIED	157
Cells Can Be Grown in a Culture Dish	157
Purification Techniques Allow Homogeneous Protein Preparations to Be Obtained from Cell Homogenates	161
Large Amounts of Almost Any Protein Can be Produced by Genetic Engineering Techniques	163
Automated Studies of Protein Structure and Function Are Increasing the Pace of Discovery	163
Essential Concepts	168
End-of-Chapter Questions	169
Chapter 5 DNA and Chromosomes	171
THE STRUCTURE AND FUNCTION OF DNA	172
A DNA Molecule Consists of Two Complementary Chains of Nucleotides	173
The Structure of DNA Provides a Mechanism for Heredity	178
THE STRUCTURE OF EUKARYOTIC CHROMOSOMES	179
Eukaryotic DNA Is Packaged into Multiple Chromosomes	179
Chromosomes Contain Long Strings of Genes	181
Chromosomes Exist in Different States Throughout the Life of a Cell	182
Interphase Chromosomes Are Organized Within the Nucleus	184
The DNA in Chromosomes Is Highly Condensed	184
Nucleosomes Are the Basic Units of Eukaryotic Chromosome Structure	185
Chromosome Packing Occurs on Multiple Levels	187
THE REGULATION OF CHROMOSOME STRUCTURE	188
Changes in Nucleosome Structure Allow Access to DNA	188
Interphase Chromosomes Contain Both Condensed and More Extended Forms of Chromatin	190
Changes in Chromatin Structure Can Be Inherited	191
Essential Concepts	192
End-of-Chapter Questions	193

Chapter 6 DNA Replication, Repair, and Recombination	197
DNA REPLICATION	198
Base-Pairing Enables DNA Replication	198
DNA Synthesis Begins at Replication Origins	199
New DNA Synthesis Occurs at Replication Forks	203
The Replication Fork Is Asymmetrical	204
DNA Polymerase Is Self-correcting	205
Short Lengths of RNA Act as Primers for DNA Synthesis	206
Proteins at a Replication Fork Cooperate to Form a Replication Machine	208
Telomerase Replicates the Ends of Eucaryotic Chromosomes	210
DNA REPAIR	211
Mutations Can Have Severe Consequences for a Cell or Organism	211
A DNA Mismatch Repair System Removes Replication Errors That Escape the Replication Machine	212
DNA Is Continually Suffering Damage in Cells	213
The Stability of Genes Depends on DNA Repair	215
Double-Strand Breaks Can be Repaired Rapidly But Imperfectly	216
A Record of the Fidelity of DNA Replication and Repair Is Preserved in Genome Sequences	217
HOMOLOGOUS RECOMBINATION	218
Homologous Recombination Requires Extensive Regions of Sequence Similarity	218
Homologous Recombination Can Flawlessly Repair DNA Double-strand Breaks	218
Homologous Recombination Exchanges Genetic Information During Meiosis	220
MOBILE GENETIC ELEMENTS AND VIRUSES	221
Mobile Genetic Elements Encode the Components They Need for Movement	222
The Human Genome Contains Two Major Families of Transposable Sequences	222
Viruses Are Fully Mobile Genetic Elements That Can Escape from Cells	223
Retroviruses Reverse the Normal Flow of Genetic Information	225
Essential Concepts	227
End-of-Chapter Questions	228
Chapter 7 From DNA to Protein: How Cells Read the Genome	231
FROM DNA TO RNA	232
Portions of DNA Sequence Are Transcribed into RNA	233
Transcription Produces RNA Complementary to One Strand of DNA	234

Several Types of RNA Are Produced in Cells	235
Signals in DNA Tell RNA Polymerase Where to Start and Finish	236
Initiation of Eucaryotic Gene Transcription Is a Complex Process	238
Eucaryotic RNA Polymerase Requires General Transcription Factors	239
Eucaryotic RNAs Are Transcribed and Processed Simultaneously in the Nucleus	240
Eucaryotic Genes Are Interrupted by Noncoding Sequences	241
Introns Are Removed by RNA Splicing	242
Mature Eucaryotic mRNAs Are Selectively Exported from the Nucleus	243
mRNA Molecules Are Eventually Degraded by the Cell	244
The Earliest Cells May Have Had Introns in Their Genes	245
FROM RNA TO PROTEIN	246
An mRNA Sequence Is Decoded in Sets of Three Nucleotides	246
tRNA Molecules Match Amino Acids to Codons in mRNA	247
Specific Enzymes Couple tRNAs to the Correct Amino Acid	251
The RNA Message Is Decoded on Ribosomes	251
The Ribosome Is a Ribozyme	253
Codons in mRNA Signal Where to Start and to Stop Protein Synthesis	254
Proteins Are Made on Polyribosomes	257
Inhibitors of Prokaryotic Protein Synthesis Are Used as Antibiotics	257
Carefully Controlled Protein Breakdown Helps Regulate the Amount of Each Protein in a Cell	258
There Are Many Steps Between DNA and Protein	259
RNA AND THE ORIGINS OF LIFE	261
Life Requires Autocatalysis	261
RNA Can Both Store Information and Catalyze Chemical Reactions	261
RNA Is Thought to Predate DNA in Evolution	263
Essential Concepts	264
End-of-Chapter Questions	266
Chapter 8 Control of Gene Expression	269
AN OVERVIEW OF GENE EXPRESSION	270
The Different Cell Types of a Multicellular Organism Contain the Same DNA	270
Different Cell Types Produce Different Sets of Proteins	270
A Cell Can Change the Expression of Its Genes in Response to External Signals	272

Gene Expression Can Be Regulated at Many of the Steps in the Pathway from DNA to RNA to Protein	272
HOW TRANSCRIPTIONAL SWITCHES WORK	273
Transcription Is Controlled by Proteins Binding to Regulatory DNA Sequences	273
Transcription Switches Allow Cells to Respond to Changes in the Environment	275
Repressors Turn Genes Off, Activators Turn Them On	276
An Activator and a Repressor Control the <i>Lac</i> Operon	277
Eucaryotic Transcription Regulators Control Gene Expression from a Distance	278
Packing of Promoter DNA into Nucleosomes Affects Initiation of Transcription	279
THE MOLECULAR MECHANISMS THAT CREATE SPECIALIZED CELL TYPES	280
Eucaryotic Genes Are Regulated by Combinations of Proteins	280
The Expression of Different Genes Can Be Coordinated by a Single Protein	281
Combinatorial Control Can Create Different Cell Types	285
Stable Patterns of Gene Expression Can Be Transmitted to Daughter Cells	287
The Formation of an Entire Organ Can Be Triggered by a Single Transcription Regulator	288
POST-TRANSCRIPTIONAL CONTROLS	289
Riboswitches Provide An Economical Solution to Gene Regulation	289
The Untranslated Regions of mRNAs Can Control Their Translation	290
Small Regulatory RNAs Control the Expression of Thousands of Animal and Plant Genes	290
RNA Interference Destroys Double-Stranded Foreign RNAs	291
Scientists Can Use RNA Interference to Turn Off Genes	292
Essential Concepts	293
End-of-Chapter Questions	294
Chapter 9 How Genes and Genomes Evolve	297
GENERATING GENETIC VARIATION	298
In Sexually Reproducing Organisms, Only Changes to the Germ Line Are Passed Along To Progeny	299
Point Mutations Are Caused by Failures of the Normal Mechanisms for Copying and Maintaining DNA	300
Point Mutations Can Change the Regulation of a Gene	301

DNA Duplications Give Rise to Families of Related Genes	302
The Evolution of the Globin Gene Family Shows How Gene Duplication and Divergence Can Give Rise to Proteins Tailored to an Organism and Its Development	304
Whole Genome Duplications Have Shaped the Evolutionary History of Many Species	305
New Genes Can Be Generated by Repeating the Same Exon	306
Novel Genes Can Also Be Created by Exon Shuffling	306
The Evolution of Genomes Has Been Accelerated by the Movement of Mobile Genetic Elements	307
Genes Can Be Exchanged Between Organisms by Horizontal Gene Transfer	308
RECONSTRUCTING LIFE'S FAMILY TREE	309
Genetic Changes That Provide a Selective Advantage Are Likely to Be Preserved	309
Human and Chimpanzee Genomes Are Similar in Organization As Well As in Detailed Sequence	310
Functionally Important Regions Show Up As Islands of Conserved DNA Sequence	310
Genome Comparisons Show That Vertebrate Genomes Gain and Lose DNA Rapidly	312
Sequence Conservation Allows Us to Trace Even the Most Distant Evolutionary Relationships	313
EXAMINING THE HUMAN GENOME	315
The Nucleotide Sequence of the Human Genome Shows How Our Genes Are Arranged	316
Accelerated Changes in Conserved Genome Sequences Help Reveal What Makes Us Human	320
Genetic Variation Within the Human Genome Contributes to Our Individuality	320
The Human Genome Contains Copious Information Yet to Be Deciphered	321
Essential Concepts	323
End-of-Chapter Questions	324
Chapter 10 Analyzing Genes and Genomes	327
MANIPULATING AND ANALYZING DNA MOLECULES	329
Restriction Nucleases Cut DNA Molecules at Specific Sites	329
Gel Electrophoresis Separates DNA Fragments of Different Sizes	330
Hybridization Provides a Sensitive Way to Detect Specific Nucleotide Sequences	332
Hybridization Is Carried Out Using DNA Probes Designed to Recognize a Desired Nucleotide Sequence	332

DNA CLONING	333
DNA Ligase Joins DNA Fragments Together to Produce a Recombinant DNA Molecule	334
Recombinant DNA Can Be Copied Inside Bacterial Cells	334
Specialized Plasmid Vectors Are Used to Clone DNA	335
Genes Can Be Isolated from a DNA Library	336
cDNA Libraries Represent the mRNA Produced by a Particular Tissue	338
The Polymerase Chain Reaction Amplifies Selected DNA Sequences	340
DECIPHERING AND EXPLOITING GENETIC INFORMATION	343
DNA Can Be Rapidly Sequenced	345
Completely Novel DNA Molecules Can Be Constructed	347
Rare Proteins Can Be Made in Large Amounts Using Cloned DNA	347
Reporter Genes and <i>In Situ</i> Hybridization Can Reveal When and Where a Gene Is Expressed	350
Hybridization on DNA Microarrays Monitors the Expression of Thousands of Genes at Once	352
Genetic Approaches Can Reveal the Function of a Gene	354
Animals Can be Genetically Altered	354
RNA Interference Provides a Simple Way to Test Gene Function	356
Transgenic Plants Are Important for Both Cell Biology and Agriculture	357
Essential Concepts	358
End-of-Chapter Questions	360
Chapter 11 Membrane Structure	363
THE LIPID BILAYER	364
Membrane Lipids Form Bilayers in Water	365
The Lipid Bilayer Is a Two-dimensional Fluid	368
The Fluidity of a Lipid Bilayer Depends on Its Composition	369
The Lipid Bilayer Is Asymmetrical	370
Lipid Asymmetry Is Preserved During Membrane Transport	371
MEMBRANE PROTEINS	372
Membrane Proteins Associate with the Lipid Bilayer in Various Ways	373
A Polypeptide Chain Usually Crosses the Bilayer as an α Helix	374
Membrane Proteins Can Be Solubilized in Detergents and Purified	375
The Complete Structure Is Known for Relatively Few Membrane Proteins	376
The Plasma Membrane Is Reinforced by the Cell Cortex	377

Cells Can Restrict the Movement of Membrane Proteins	379
The Cell Surface Is Coated with Carbohydrate	380
Essential Concepts	384
End-of-Chapter Questions	385
Chapter 12 Membrane Transport	387
PRINCIPLES OF MEMBRANE TRANSPORT	388
The Ion Concentrations Inside a Cell Are Very Different from Those Outside	388
Lipid Bilayers Are Impermeable to Solutes and Ions	389
Membrane Transport Proteins Fall into Two Classes: Transporters and Channels	389
Solutes Cross Membranes by Passive or Active Transport	390
TRANSPORTERS AND THEIR FUNCTIONS	391
Concentration Gradients and Electrical Forces Drive Passive Transport	392
Active Transport Moves Solutes Against Their Electrochemical Gradients	393
Animal Cells Use the Energy of ATP Hydrolysis to Pump Out Na^+	394
The Na^+ - K^+ Pump Is Driven by the Transient Addition of a Phosphate Group	394
The Na^+ - K^+ Pump Helps Maintain the Osmotic Balance of Animal Cells	396
Intracellular Ca^{2+} Concentrations Are Kept Low by Ca^{2+} Pumps	397
Coupled Transporters Exploit Gradients to Take Up Nutrients Actively	398
H^+ Gradients Are Used to Drive Membrane Transport in Plants, Fungi, and Bacteria	400
ION CHANNELS AND THE MEMBRANE POTENTIAL	400
Ion Channels Are Ion-selective and Gated	401
Ion Channels Randomly Snap Between Open and Closed States	403
Different Types of Stimuli Influence the Opening and Closing of Ion Channels	405
Voltage-gated Ion Channels Respond to the Membrane Potential	405
Membrane Potential Is Governed by Membrane Permeability to Specific Ions	407
ION CHANNELS AND SIGNALING IN NERVE CELLS	409
Action Potentials Provide for Rapid Long-Distance Communication	409
Action Potentials Are Usually Mediated by Voltage-gated Na^+ Channels	410
Voltage-gated Ca^{2+} Channels Convert Electrical Signals into Chemical Signals at Nerve Terminals	415

Transmitter-gated Channels in Target Cells Convert Chemical Signals Back into Electrical Signals	415
Neurons Receive Both Excitatory and Inhibitory Inputs	417
Transmitter-gated Ion Channels Are Major Targets for Psychoactive Drugs	418
Synaptic Connections Enable You to Think, Act, and Remember	419
Essential Concepts	420
End-of-Chapter Questions	421

Chapter 13 How Cells Obtain Energy from Food 425

THE BREAKDOWN AND UTILIZATION OF SUGARS AND FATS	426
Food Molecules Are Broken Down in Three Stages	426
Glycolysis Is a Central ATP-producing Pathway	427
Fermentations Allow ATP to Be Produced in the Absence of Oxygen	432
Glycolysis Illustrates How Enzymes Couple Oxidation to Energy Storage	433
Sugars and Fats Are Both Degraded to Acetyl CoA in Mitochondria	436
The Citric Acid Cycle Generates NADH by Oxidizing Acetyl Groups to CO ₂	436
Many Biosynthetic Pathways Begin with Glycolysis or the Citric Acid Cycle	439
Electron Transport Drives the Synthesis of the Majority of the ATP in Most Cells	444
REGULATION OF METABOLISM	445
Catabolic and Anabolic Reactions Are Organized and Regulated	445
Feedback Regulation Allows Cells to Switch from Glucose Degradation to Glucose Biosynthesis	447
Cells Store Food Molecules in Special Reservoirs to Prepare for Periods of Need	448
Essential Concepts	450
End-of-Chapter Questions	451

Chapter 14 Energy Generation in Mitochondria and Chloroplasts 453

Cells Obtain Most of Their Energy by a Membrane-based Mechanism	454
MITOCHONDRIA AND OXIDATIVE PHOSPHORYLATION	456
A Mitochondrion Contains an Outer Membrane, an Inner Membrane, and Two Internal Compartments	456
The Citric Acid Cycle Generates High-Energy Electrons	458
A Chemiosmotic Process Converts the Energy From Activated Carrier Molecules into ATP	458

The Electron-Transport Chain Pumps Protons Across the Inner Mitochondrial Membrane	460
Proton Pumping Creates a Steep Electrochemical Proton Gradient Across the Inner Mitochondrial Membrane	460
The Electrochemical Proton Gradient Drives ATP Synthesis	461
Coupled Transport Across the Inner Mitochondrial Membrane Is Also Driven by the Electrochemical Proton Gradient	463
Oxidative Phosphorylation Produces Most of the Cell's ATP	464
The Rapid Conversion of ADP to ATP in Mitochondria Maintains a High ATP/ADP Ratio in Cells	465
MOLECULAR MECHANISMS OF ELECTRON TRANSPORT AND PROTON PUMPING	466
Protons Are Readily Moved by the Transfer of Electrons	466
The Redox Potential Is a Measure of Electron Affinities	467
Electron Transfers Release Large Amounts of Energy	470
Metals Tightly Bound to Proteins Form Versatile Electron Carriers	470
Cytochrome Oxidase Catalyzes the Reduction of Molecular Oxygen	473
The Mechanism of H ⁺ Pumping Can Be Studied in Atomic Detail	474
Respiration Is Amazingly Efficient	475
CHLOROPLASTS AND PHOTOSYNTHESIS	476
Chloroplasts Resemble Mitochondria but Have an Extra Compartment	477
Chloroplasts Capture Energy from Sunlight and Use It to Fix Carbon	478
Sunlight is Absorbed by Chlorophyll Molecules	479
Excited Chlorophyll Molecules Funnel Energy into a Reaction Center	480
Light Energy Drives the Synthesis of Both ATP and NADPH	481
Chloroplasts Can Adjust their ATP Production	483
Carbon Fixation Uses ATP and NADPH to Convert CO ₂ into Sugars	484
Sugars Generated by Carbon Fixation Can Be Stored As Starch or Consumed to Produce ATP	486
THE ORIGINS OF CHLOROPLASTS AND MITOCHONDRIA	486
Oxidative Phosphorylation Might Have Given Ancient Bacteria an Evolutionary Advantage	487
Photosynthetic Bacteria Made Even Fewer Demands on Their Environment	488
The Lifestyle of <i>Methanococcus</i> Suggests That Chemiosmotic Coupling Is an Ancient Process	490
Essential Concepts	491
End-of-Chapter Questions	492

Chapter 15 Intracellular Compartments and Transport	495
MEMBRANE-ENCLOSED ORGANELLES	496
Eucaryotic Cells Contain a Basic Set of Membrane-enclosed Organelles	496
Membrane-enclosed Organelles Evolved in Different Ways	498
PROTEIN SORTING	500
Proteins Are Imported into Organelles by Three Mechanisms	500
Signal Sequences Direct Proteins to the Correct Compartment	501
Proteins Enter the Nucleus Through Nuclear Pores	502
Proteins Unfold to Enter Mitochondria and Chloroplasts	505
Proteins Enter the Endoplasmic Reticulum While Being Synthesized	505
Soluble Proteins Are Released into the ER Lumen	507
Start and Stop Signals Determine the Arrangement of a Transmembrane Protein in the Lipid Bilayer	508
VESICULAR TRANSPORT	510
Transport Vesicles Carry Soluble Proteins and Membrane Between Compartments	510
Vesicle Budding Is Driven by the Assembly of a Protein Coat	511
Vesicle Docking Depends on Tethers and SNAREs	512
SECRETORY PATHWAYS	514
Most Proteins Are Covalently Modified in the ER	514
Exit from the ER Is Controlled to Ensure Protein Quality	516
The Size of the ER Is Controlled by the Amount of Protein that Flows Through It	516
Proteins Are Further Modified and Sorted in the Golgi Apparatus	517
Secretory Proteins Are Released from the Cell by Exocytosis	518
ENDOCYTOTIC PATHWAYS	522
Specialized Phagocytic Cells Ingest Large Particles	522
Fluid and Macromolecules Are Taken Up by Pinocytosis	523
Receptor-mediated Endocytosis Provides a Specific Route into Animal Cells	524
Endocytosed Macromolecules Are Sorted in Endosomes	525
Lysosomes Are the Principal Sites of Intracellular Digestion	526
Essential Concepts	527
End-of-Chapter Questions	529

Chapter 16 Cell Communication	531
GENERAL PRINCIPLES OF CELL SIGNALING	532
Signals Can Act over a Long or Short Range	532
Each Cell Responds to a Limited Set of Signals, Depending on Its History and Its Current State	534
A Cell's Response to a Signal Can Be Fast or Slow	536
Some Hormones Cross the Plasma Membrane and Bind to Intracellular Receptors	537
Some Dissolved Gases Cross the Plasma Membrane and Activate Intracellular Enzymes Directly	538
Cell-Surface Receptors Relay Extracellular Signals via Intracellular Signaling Pathways	539
Some Intracellular Signaling Proteins Act as Molecular Switches	541
Cell-Surface Receptors Fall into Three Main Classes	542
Ion-channel-coupled Receptors Convert Chemical Signals into Electrical Ones	544
G-PROTEIN-COUPLED RECEPTORS	544
Stimulation of GPCRs Activates G-Protein Subunits	545
Some G Proteins Directly Regulate Ion Channels	547
Some G Proteins Activate Membrane-bound Enzymes	547
The Cyclic AMP Pathway Can Activate Enzymes and Turn On Genes	548
The Inositol Phospholipid Pathway Triggers a Rise in Intracellular Ca^{2+}	551
A Ca^{2+} Signal Triggers Many Biological Processes	552
Intracellular Signaling Cascades Can Achieve Astonishing Speed, Sensitivity, and Adaptability	554
ENZYME-COUPLED RECEPTORS	555
Activated RTKs Recruit a Complex of Intracellular Signaling Proteins	555
Most RTKs Activate the Monomeric GTPase Ras	556
RTKs Activate PI 3-Kinase to Produce Lipid Docking Sites in the Plasma Membrane	558
Some Receptors Activate a Fast Track to the Nucleus	559
Multicellularity and Cell Communication Evolved Independently in Plants and Animals	564
Protein Kinase Networks Integrate Information to Control Complex Cell Behaviors	564
Essential Concepts	567
End-of-Chapter Questions	569
Chapter 17 Cytoskeleton	571
INTERMEDIATE FILAMENTS	572
Intermediate Filaments Are Strong and Ropelike	574

Intermediate Filaments Strengthen Cells Against Mechanical Stress	575
The Nuclear Envelope Is Supported by a Meshwork of Intermediate Filaments	576
MICROTUBULES	577
Microtubules Are Hollow Tubes with Structurally Distinct Ends	578
The Centrosome Is the Major Microtubule-organizing Center in Animal Cells	579
Growing Microtubules Show Dynamic Instability	580
Microtubules Are Maintained by a Balance of Assembly and Disassembly	581
Microtubules Organize the Interior of the Cell	582
Motor Proteins Drive Intracellular Transport	583
Organelles Move Along Microtubules	584
Cilia and Flagella Contain Stable Microtubules Moved by Dynein	585
ACTIN FILAMENTS	590
Actin Filaments Are Thin and Flexible	591
Actin and Tubulin Polymerize by Similar Mechanisms	591
Many Proteins Bind to Actin and Modify Its Properties	592
An Actin-rich Cortex Underlies the Plasma Membrane of Most Eucaryotic Cells	594
Cell Crawling Depends on Actin	594
Actin Associates with Myosin to Form Contractile Structures	597
Extracellular Signals Control the Arrangement of Actin Filaments	597
MUSCLE CONTRACTION	599
Muscle Contraction Depends on Bundles of Actin and Myosin	599
During Muscle Contraction Actin Filaments Slide Against Myosin Filaments	600
Muscle Contraction Is Triggered by a Sudden Rise in Ca^{2+}	602
Muscle Cells Perform Highly Specialized Functions in the Body	604
Essential Concepts	605
End-of-Chapter Questions	606
Chapter 18 The Cell Division Cycle	609
OVERVIEW OF THE CELL CYCLE	610
The Eucaryotic Cell Cycle Is Divided into Four Phases	611
A Cell-Cycle Control System Triggers the Major Processes of the Cell Cycle	612
Cell-Cycle Control is Similar in All Eucaryotes	613
THE CELL-CYCLE CONTROL SYSTEM	613
The Cell-Cycle Control System Depends on Cyclically Activated Protein Kinases called Cdks	614

The Activity of Cdks Is Also Regulated by Phosphorylation and Dephosphorylation	614
Different Cyclin–Cdk Complexes Trigger Different Steps in the Cell Cycle	617
The Cell-Cycle Control System Also Depends on Cyclical Proteolysis	618
Proteins that Inhibit Cdks Can Arrest the Cell Cycle at Specific Checkpoints	618
S PHASE	620
S-Cdk Initiates DNA Replication and Helps Block Re-Replication	620
Cohesins Help Hold the Sister Chromatids of Each Replicated Chromosome Together	621
DNA Damage Checkpoints Help Prevent the Replication of Damaged DNA	621
M PHASE	622
M-Cdk Drives Entry Into M Phase and Mitosis	622
Condensins Help Configure Duplicated Chromosomes for Separation	623
The Cytoskeleton Carries Out Both Mitosis and Cytokinesis	624
M Phase Is Conventionally Divided into Six Stages	624
MITOSIS	625
Centrosomes Duplicate To Help Form the Two Poles of the Mitotic Spindle	625
The Mitotic Spindle Starts to Assemble in Prophase	628
Chromosomes Attach to the Mitotic Spindle at Prometaphase	628
Chromosomes Aid in the Assembly of the Mitotic Spindle	630
Chromosomes Line Up at the Spindle Equator at Metaphase	630
Proteolysis Triggers Sister-Chromatid Separation and the Completion of Mitosis	631
Chromosomes Segregate During Anaphase	631
Unattached Chromosomes Block Sister-Chromatid Separation	633
The Nuclear Envelope Re-forms at Telophase	634
CYTOKINESIS	634
The Mitotic Spindle Determines the Plane of Cytoplasmic Cleavage	634
The Contractile Ring of Animal Cells Is Made of Actin and Myosin	635
Cytokinesis in Plant Cells Involves the Formation of a New Cell Wall	636
Membrane-Enclosed Organelles Must Be Distributed to Daughter Cells When a Cell Divides	638
CONTROL OF CELL NUMBER AND CELL SIZE	638
Apoptosis Helps Regulate Animal Cell Numbers	638

Apoptosis Is Mediated by an Intracellular Proteolytic Cascade	639
The Death Program Is Regulated by the Bcl2 Family of Intracellular Proteins	641
Animal Cells Require Extracellular Signals to Survive, Grow, and Divide	642
Animal Cells Require Survival Factors to Avoid Apoptosis	643
Mitogens Stimulate Cell Division	644
Growth Factors Stimulate Cells to Grow	645
Some Extracellular Signal Proteins Inhibit Cell Survival, Division, or Growth	645
Essential Concepts	647
End-of-Chapter Questions	649
Chapter 19 Sex and Genetics	651
THE BENEFITS OF SEX	652
Sexual Reproduction Involves Both Diploid and Haploid Cells	652
Sexual Reproduction Gives Organisms a Competitive Advantage	654
MEIOSIS AND FERTILIZATION	655
Haploid Germ Cells Are Produced From Diploid Cells Through Meiosis	655
Meiosis Involves a Special Process of Chromosome Pairing	656
Crossing-Over Can Occur Between Maternal and Paternal Chromosomes	657
Chromosome Pairing and Recombination Ensure the Proper Segregation of Homologs	658
The Second Meiotic Division Produces Haploid Daughter Cells	659
Haploid Cells Contain Reassorted Genetic Information	661
Meiosis Is Not Flawless	662
Fertilization Reconstitutes a Complete Diploid Genome	663
MENDEL AND THE LAWS OF INHERITANCE	664
Mendel Chose to Study Traits That Are Inherited in a Discrete Fashion	665
Mendel Could Disprove the Alternative Theories of Inheritance	665
Mendel's Experiments Were the First to Reveal the Discrete Nature of Heredity	666
Each Gamete Carries a Single Allele for Each Character	667
Mendel's Law of Segregation Applies to All Sexually Reproducing Organisms	668
Alleles for Different Traits Segregate Independently	669
The Behavior of Chromosomes During Meiosis Underlies Mendel's Laws of Inheritance	671

Chromosome Crossovers Can Be Used to Determine the Order of Genes	671
Mutations in Genes Can Cause a Loss of Function Or a Gain of Function	673
Each of Us Carries Many Potentially Harmful Recessive Mutant Alleles	673
GENETICS AS AN EXPERIMENTAL TOOL	675
The Classical Approach Begins with Random Mutagenesis	675
Genetic Screens Identify Mutants Deficient in Specific Cellular Processes	676
A Complementation Test Reveals Whether Two Mutations Are in the Same Gene	677
Single-Nucleotide Polymorphisms (SNPs) Serve as Landmarks for Genetic Mapping	678
Linked Groups of SNPs Define Haplotype Blocks	682
Haplotype Blocks Give Clues to our Evolutionary History	683
Essential Concepts	684
End-of-Chapter Questions	685
Chapter 20 Cellular Communities: Tissues, Stem Cells, and Cancer	689
EXTRACELLULAR MATRIX AND CONNECTIVE TISSUES	690
Plant Cells Have Tough External Walls	691
Cellulose Microfibrils Give the Plant Cell Wall Its Tensile Strength	692
Animal Connective Tissues Consist Largely of Extracellular Matrix	693
Collagen Provides Tensile Strength in Animal Connective Tissues	694
Cells Organize the Collagen That They Secrete	696
Integrins Couple the Matrix Outside a Cell to the Cytoskeleton Inside It	696
Gels of Polysaccharide and Protein Fill Spaces and Resist Compression	698
EPITHELIAL SHEETS AND CELL JUNCTIONS	700
Epithelial Sheets Are Polarized and Rest on a Basal Lamina	700
Tight Junctions Make an Epithelium Leak-proof and Separate Its Apical and Basal Surfaces	701
Cytoskeleton-linked Junctions Bind Epithelial Cells Robustly to One Another and to the Basal Lamina	703
Gap Junctions Allow Ions and Small Molecules to Pass from Cell to Cell	705
TISSUE MAINTENANCE AND RENEWAL	707
Tissues Are Organized Mixtures of Many Cell Types	709
Different Tissues Are Renewed at Different Rates	710
Stem Cells Generate a Continuous Supply of Terminally Differentiated Cells	711

Specific Signals Maintain the Stem-Cell Populations	713
Stem Cells Can Be Used to Repair Damaged Tissues	714
Therapeutic Cloning Could Provide a Way to Generate Personalized ES Cells	715
CANCER	717
Cancer Cells Proliferate, Invade, and Metastasize	718
Epidemiology Identifies Preventable Causes of Cancer	718
Cancers Develop by an Accumulation of Mutations	719
Cancer Cells Evolve Properties that Give Them a Competitive Advantage	721
Many Diverse Types of Genes Are Critical for Cancer	722
Colorectal Cancer Illustrates How Loss of a Gene Can Lead to Growth of a Tumor	723
An Understanding of Cancer Cell Biology Opens the Way to New Treatments	727
Essential Concepts	729
End-of-Chapter Questions	731
