Preface xiv

Introduction 1

1 Material Cycles

1.1 Geochemical cycles

- 1.1.1 Environmental areas 2
- 1.1.2 Endogenous and exogenous material cycles 2
- 1.1.3 The geological material cycle 4
- 1.1.4 The 'crust-ocean machine' 4
- 1.1.5 The Earth as a biogeochemical factory 6

1.2 The carbon cycle

- 1.2.1 Mineralisation and biosynthesis 8

1.3 The nitrogen cycle

- 1.3.1 The global nitrogen cycle 10
- 1.3.2 Anthropogenic effects 10
- 1.3.3 Ammonification, nitrification, denitrification 12

1.4 The sulphur cycle

- 1.4.1 The global sulphur cycle 14
- 1.4.2 The biochemical sulphur cycle 14
- 1.4.3 Environmentally relevant sulphur compounds 16
- 1.4.4 Emissions and transformations 16

1.5 The phosphorus cycle

- 1.5.1 The global phosphorus cycle 18
- 1.5.2 The biogeochemical phosphorus cycle 18

1.6 Metal cycles

- 1.6.1 The global anthropogenous cycle 20
- 1.6.2 The geochemical cycle 20
- 1.6.3 The biogeochemical cycle 20

1.7 Special cycles

- 1.7.1 Cycles of environmental chemicals 22

- 1.7.2 Interrelationships among the C, S, P, N and O cycles 24
- 1.7.3 Bacterial and biochemical cycles in the sedimentation of a lake 24
- 1.7.4 Anthropogenously related surface material flow 26
- 1.7.5 Material cycles with links to the environment 26
- 1.7.6 The ecologically orientated material cycle 28

2 The Atmosphere

2.1 Physicochemical processes

- 2.1.1 Global energy balance 30
- 2.1.2 Composition of the atmosphere 30
- 2.1.3 Basic physicochemical processes 32
- 2.1.4 Box model of atmospheric chemistry 32
- 2.1.5 Linking the carbon and oxygen cycles 34
- 2.1.6 Role of carbon dioxide 34
- 2.1.7 General behaviour of trace elements in the atmosphere 36
- 2.1.8 Cycle of atmospheric aerosol particles 36

2.2 Ecological photochemistry

- 2.2.1 Chemistry and photochemistry 38
- 2.2.2 Emission and deposition under different weather conditions 38
- 2.2.3 Catalytic cycles of atmospheric ozone chemistry 40
- 2.2.4 Ozone: formation and decomposition 42
- 2.2.5 Ozone and the catalytic NO_x cycles 42
- 2.2.6 Photochemistry of the OH radical 44
- 2.2.7 Scheme of the catalytic HO_x cycles 44

- 2.2.8 Scheme of halogen photochemistry in the atmosphere 46
- 2.2.9 The global atmospheric chlorine cycle 46
- 2.2.10 Scheme of the catalytic ClO_x cycle 46
- 2.2.11 Splitting of chlorofluoromethanes 46
- 2.3 Air pollution from combustion**
- 2.3.1 Sources of air pollution 48
- 2.3.2 Quantification of air pollutants according to source 48
- 2.3.3 Emissions from burning vegetation 48
- 2.3.4 Nitrogen oxide: formation and lowering of levels 50
- 2.4 Anthropogenous pollutants and their effects**
- 2.4.1 Anthropogenous emissions in West Germany in 1984 52
- 2.4.2 Immissions near ground level 52
- 2.4.3 Pollutant flows during waste incineration 54
- 2.4.4 Waste incineration in Germany 54
- 2.4.5 Acid formation from NO_x and SO_2 56
- 2.4.6 Air pollution as a stress factor in the ecosystem of a forest 56
- 2.4.7 Deposition of fine particles in the human respiratory tract 58
- 2.4.8 Points of attack in the respiratory tract dependent on water solubility 58
- 2.4.9 Effects of CO in the bloodstream 58
- 2.4.10 Sources of pollution in living and working environments 60
- 2.5 Principles of air quality control**
- 2.5.1 Techniques for cleaning exhaust air 62
- 2.5.2 Comparison of different dust particle separation systems 64
- 2.5.3 Thermal decomposition of organic materials 64
- 2.5.4 Formation and thermal decomposition of chlorinated dibenzodioxins and dibenzofurans 64
- 2.5.5 Combination process for cleaning exhaust gas 66
- 2.5.6 Catalytic NO_x reduction 66
- 2.5.7 Desulphurisation processes 66
- 2.5.8 Simultaneous processes for desulphurisation and denitration of exhaust gas 68
- 2.5.9 Adsorption plant for solvent recovery 68
- 2.5.10 Construction of a biological gas-washing plant 68
- 2.5.11 Automobile exhaust and its cleaning 70
- 2.5.12 Landfill gases and low-pollution combustion 72
- 3 Water**
- 3.1 The Earth's water cycle**
- 3.1.1 The hydrological cycle 74
- 3.1.2 Box model for water chemistry 74
- 3.1.3 Distribution of water by volume 74
- 3.1.4 Quantitative water content of the Earth 76
- 3.1.5 Average water content in Germany 76
- 3.1.6 Interactions between water and land 78
- 3.1.7 Food chain and material cycle in bodies of water 80
- 3.1.8 Quantified material cycle in the open sea 80
- 3.1.9 Water cycle with anthropogenic influences 82

- 3.1.10 Water cycle in the area of water–soil–vegetation 82
- 3.1.11 pH–pE diagrams with atmospheric influences 84
- 3.1.12 Carbon species in bodies of water 84
- 3.2 Chemistry in bodies of water**
- 3.2.1 Equilibrium diagrams of some molecule/ion systems 86
- 3.2.2 Carbonate species in rainwater 86
- 3.2.3 Ca^{2+} and HCO_3^- ions in rivers 86
- 3.2.4 Solubility of aluminium species 88
- 3.2.5 Species partition of Al–hydroxo complexes 88
- 3.2.6 Equilibria between nitrate and ammonium ions 88
- 3.2.7 Conversion of ammonium in running waters 88
- 3.2.8 pE–pH diagram for iron species 90
- 3.2.9 Concentration–pE diagrams for chlorine species 90
- 3.2.10 Genesis of rainwater 92
- 3.2.11 Pathways of emitted acid producers and their effects on animals in water 92
- 3.2.12 Emission and transport processes of trace metals in riverbeds 94
- 3.2.13 Cycles and reactions of metals in bodies of water 94
- 3.2.14 Reactions of metal ions in a lake 96
- 3.2.15 Areas of existence of metal–aquo complexes, water hydroxo and oxo complexes 96
- 3.3 Processes for the preparation of drinking water**
- 3.3.1 Preparation of Danube River water for use as drinking water 98
- 3.3.2 Classical processes for the preparation of drinking water 100
- 3.3.3 Electrodialysis in a three-chamber cell 100
- 3.3.4 Desalination of water by reverse osmosis 100
- 3.4 Basic principles of waste water chemistry and sewage treatment**
- 3.4.1 Local treatment plant as a direct discharger 102
- 3.4.2 Layout of a mechanical–biological water treatment plant 102
- 3.4.3 Composition of sewage and its possible treatment 104
- 3.4.4 Variations in the amount of municipal sewage 104
- 3.4.5 Biochemical oxygen demand, BOD 104
- 3.4.6 Anaerobic degradation of organic materials 106
- 3.4.7 Basic principles of anaerobic purification processes 106
- 3.4.8 Kinetics of flocculation and filtration 108
- 3.4.9 Effectiveness of chemicals in water technology 108
- 3.4.10 Precipitation–pH ranges of metals 110
- 3.4.11 Sewage treatment plant with precipitation of phosphate 110
- 3.4.12 Sludge formation and BOD 112
- 3.4.13 Oxygen consumption for metabolic processes 112
- 3.4.14 Elimination of phosphate 112
- 3.4.15 Nitrogen conversion during sewage treatment 114
- 3.4.16 Denitrification process 114
- 3.4.17 Waste water treatment in the metal-working (automobile) industry 116
- 3.4.18 Mechanical–biological–chemical sewage treatment plant with sludge treatment 116

4 Soil**4.1 Basic principles of soil science**

- 4.1.1 The soil in the environment of the litho-, hydro- and atmosphere 118
- 4.1.2 Components of the litho-, bio-, hydro- and atmosphere 118
- 4.1.3 Interrelationships among types of rock 120
- 4.1.4 Types of rock 120
- 4.1.5 Soil granulation classes 122
- 4.1.6 Clod structures of soil 122
- 4.1.7 Soil horizons 124
- 4.1.8 The four physical states of soil 124

4.2 Physico- and biogeochemical processes

- 4.2.1 Soil functions 126
- 4.2.2 Soil components 126
- 4.2.3 Composition of arable land 126
- 4.2.4 Relationship between water tension and water content: pF graphs 128
- 4.2.5 Volumes of water, air and substances as a factor of soil type 128
- 4.2.6 Oxygen and carbon dioxide content in the air in soil 128
- 4.2.7 Formation, transformation and decomposition of clay minerals 130
- 4.2.8 Arrangement of elements in two- and three-layered clay minerals 130
- 4.2.9 Structural types of silicates 130
- 4.2.10 Weathering of potash feldspar to form clay minerals 132
- 4.2.11 Clay minerals as polyfunctional exchangers 132
- 4.2.12 Diagenesis and humification 134
- 4.2.13 Soil and humus 134
- 4.2.14 Biogenesis of humic substances 138
- 4.2.15 Synthesis of humic substances 138
- 4.2.16 Structural model of a humic system 138
- 4.2.17 Dynamic processes in the soil 140

- 4.2.18 Weathering and gas exchange 140

4.3 Metals and acid rain

- 4.3.1 Potassium dynamics in the soil 142
- 4.3.2 Balancing out heavy metals in the upper soil layer 142
- 4.3.3 Soil pH and uptake of metals 142
- 4.3.4 Transport and activity of melting salts 144
- 4.3.5 Transport pathways of lead 144
- 4.3.6 Formation of lead emission in airborne particles 146
- 4.3.7 Frequency distribution of lead and cadmium in garden soils 146
- 4.3.8 Standardised lead levels in the A_p soil horizon near a non-ferrous heavy metal emitter 148
- 4.3.9 Accumulation of heavy metals 148
- 4.3.10 Behaviour of heavy metals in the soil 150
- 4.3.11 Mobilisation of heavy metals with various extraction agents 152
- 4.3.12 Deposition of acid rain 154
- 4.3.13 Influence of acid rain on the ecosystem of the forests 154
- 4.3.14 Processes in the soil 154
- 4.3.15 Acid rain as the cause of new-type forest decline 156
- 4.3.16 Effects of acid emissions on Cologne Cathedral 158

4.4 Organic contaminants

- 4.4.1 Example of an impacted industrial area 160
- 4.4.2 Behaviour of pollutants in the soil 162
- 4.4.3 Distribution of chlorinated hydrocarbons in soil atmosphere 162
- 4.4.4 Behaviour of pesticides in the soil 162
- 4.4.5 Amounts of measurable materials in impacted soil 164

- 4.4.6 Summation curves of oxygen consumption in soil contaminated with oil 164
- 4.5 Methods for soil remediation**
- 4.5.1 Emission pathways from a hazardous waste site 166
- 4.5.2 Soil remediation procedures 166
- 4.5.3 Counterflow extraction with solvents 168
- 4.5.4 Thermal hazardous waste site remediation 168
- 4.5.5 Biological hazardous waste site remediation 170
- 4.5.6 Remediation of contaminated groundwater and of soil atmosphere 170
- 4.6 Chemistry and technology in landfills**
- 4.6.1 Construction of a landfill 172
- 4.6.2 Sources of groundwater contamination risk near a landfill 172
- 4.6.3 Development of the waste volume and its composition 172
- 4.6.4 Anaerobic decomposition processes in landfills 174
- 4.6.5 Flow process of a waste fermentation plant 176
- 4.6.6 Removal and use of landfill gas 176
- 5 Environmental Chemistry of Selected Xenobiotics and Heavy Metals**
- 5.1 Pathways of pollutants, food chains and properties of materials**
- 5.1.1 Pollutant pathways in ecosystems 178
- 5.1.2 Basic principles of pollutant distribution and transformation 178
- 5.1.3 Food chain and energy flow 180
- 5.1.4 Food pyramid 180
- 5.1.5 Food chain network 180
- 5.1.6 Materials properties and environmental behaviour 182
- 5.1.7 Ecochemical materials properties 184
- 5.1.8 Fundamental processes of material transfer between atmosphere and ocean 184
- 5.2 General decomposition pathways**
- 5.2.1 Reaction enthalpies for decomposition reactions of biomass 186
- 5.2.2 Reductive (anaerobic) reactions of xenobiotics 186
- 5.2.3 Bacterial decomposition of aromatic compounds 188
- 5.2.4 Decomposition of aromatic nitro compounds 188
- 5.3 Hydrocarbons: PAHs and PCBs**
- 5.3.1 Formation of chlorinated compounds during combustion processes 190
- 5.3.2 Decomposition of alkanes in the troposphere 190
- 5.3.3 Mechanisms for PAH decomposition in prokaryotes and eukaryotes 192
- 5.3.4 Elimination pathways during the biochemical decomposition of PAHs in the soil 192
- 5.3.5 Ways of distributing polychlorinated biphenyls (PCBs) 194
- 5.3.6 Bioaccumulation of PCBs 194
- 5.3.7 Decomposition of PCBs 194
- 5.4 Dibenzodioxins and dibenzofurans**
- 5.4.1 Sources and pathways of dioxins 196
- 5.4.2 Contaminants in commercial chlorophenol products 196
- 5.4.3 Structural formulas and toxicity equivalents 198

5.4.4 Formation and intake by humans 198

5.5 Pesticides and tensides

- 5.5.1 Behaviour of pesticides in the soil 200
- 5.5.2 Persistence of pesticides in soils 200
- 5.5.3 Biotic decomposition of ethene bithiocarbamates 200
- 5.5.4 Decomposition of parathion in cattle 202
- 5.5.5 Microbial decomposition of parathion 202
- 5.5.6 Decomposition of herbicides containing aromatic nitrogen 204
- 5.5.7 Decomposition of straight-chained alkylbenzene sulphonates (tensides) 204

5.6 Heavy metals and their species

- 5.6.1 Heavy metal species in natural bodies of water 206
- 5.6.2 Concentration and activity 206
- 5.6.3 Chromium species in tannery waste water 206
- 5.6.4 Mercury 'spider': applications and activity 208
- 5.6.5 Environmental chemistry of mercury 208
- 5.6.6 Ecochemical reactions of arsenic 210
- 5.6.7 Transformations of arsenic species in the ocean 210

6 Problem- and Activity-Oriented Environmental Analysis

6.1 Environmental analysis – strategies and concepts

- 6.1.1 Mobile on-site analysis 212
- 6.1.2 Rapid-test procedures 212
- 6.1.3 Conceptual environmental analysis 214

6.1.4 Risk assessment during examination of hazardous waste sites 216

- 6.1.5 Water studies near landfills 218
- 6.1.6 Strategies for the analysis of contaminated soils 220
- 6.1.7 Luminescent bacteria test for activity-related analysis of contaminants 222
- 6.1.8 Outline for pesticide analysis in environmental samples 224
- 6.1.9 Modern sample preparation for soils contaminated with PCBs 224
- 6.1.10 Analytical methods for hydrocarbons and PAHs in soils 226
- 6.1.11 Sample processing and determination of pesticides 226

6.2 Ecotoxicological concepts for evaluating risk

- 6.2.1 Flowchart for rapidly classifying chemicals 228
- 6.2.2 Developing an environmental risk profile 230
- 6.2.3 Exposure analysis based on the 'Unit World' fugacity model 232
- 6.2.4 Evaluation of monitoring data 232
- 6.2.5 Risk evaluation according to the E4 Chem model 234
- 6.2.6 The EXTND submodel for exposure analysis 234
- 6.2.7 The OECD standard environmental model 234
- 6.2.8 Compartments and processes in an environment model 236
- 6.2.9 Activity analysis using a computer study 236
