List of figures	xi
Preface	xiii
1. Introduction	1
What is attention?	1
Varieties of attention	3
Is attention a causal agent or an emergent property?	9
Preview of the book	10
Structure of the book	11
Summary	14
Further reading	14
2. The rise of attention research: A cognitive approach	15
Beginnings	15
Early experiments on selective auditory attention: Dichotic listening	16
Challenges to filter theory	22
Is selection later rather than earlier?	24
The early-late debate begins	25
Early experiments on selective visual attention	27
Sperling's experiments	27
The partial report superiority effect	29
Experimental evidence for separate identity and location coding in vision	32
Pertinent and unattended information	35
More models of selective attention	37
Modifications to filter theory	37
Summary	40
Further reading	41
3. The nature of visual attention	43
Introduction	43
Selective filtering and selective set	43
Selective set experiments	44
Recent work on flanker compatibility:	
The argument continues	46

Perceptual load and selective attention	48
Attention as a spotlight: Spatial cueing	52
Overt and covert orienting	56
Inhibition of return	61
Variable spotlight or zoom lens?	63
Local and global processing	66
Hemispheric differences in attention	67
Visual neglect	68
Other theoretical accounts of disorders of visual attention	76
Summary	79
Further reading	80
4. Combining the attributes of objects and visual search	83
One object but many attributes: The binding problem	83
Experimental evidence for the separability of identity and location information	84
Attentional dyslexia	84
Neurophysiological evidence for independent codes	85
Putting it all together	86
Visual search with focal attention	88
Feature integration theory	89
Attentional engagement theory: Visual search and visual similarity	93
A neurophysiological explanation of the binding problem	99
Some connectionist models of visual search and visual attention	102
A model for "attention"?	113
Summary	116
Further reading	117
5. Auditory and crossmodal attention	119
The nature of sound: Patterns in time	119
Auditory space	120
Orienting and focusing auditory attention	121
Selection from brief multi-element displays	127
Segregating auditory features	128
Combining auditory features	131
Focusing on frequency	134
Crossmodal links in auditory and visual spatial attention	136
Crossmodal attention in vision and touch	138
Spatial coordinates of crossmodal attention	139
Visual capture of touch: The rubber gloves illusion	140
Which sense is dominant?	141
Illusory conjunctions between vision and touch	142

The modality appropriateness interpretation	145
Parietal cortex and crossmodal attention	146
Pain and attention	147
Summary	150
Further reading	152
6. Task combination and divided attention	153
Introduction	153
Single channel or general purpose processing capacity?	154
Measuring resource allocation	158
Dual task performance: How many resources?	160
The psychological refractory period	164
Alternative accounts of PRP	169
How are tasks controlled in the PRP task?	173
Attentional blink	174
Summary	179
Further reading	180
7. Automaticity, skill and expertise	183
Introduction	183
Learning to do two things at once	184
Two process theory of attention: Automatic and controlled processing	185
Shiffrin and Schneider's theory	189
Neuman's critique of two process theory	191
Modelling the Stroop task	195
Attentional control as a skill	197
Production systems	204
Automatic processing and conscious interference in motor skills	209
Focus of attention in motor skill learning	210
Long-term working memory and skill	211
Summary	213
Further reading	214
8. Selection and control of action	215
Asking the right questions	215
A paradox	216
Metaphors of mind	217
Possible functions of attention	218
Selection for action	219
Reaching and grasping	226
Intentional control of actions	229
Functional deficits following frontal damage	230
Theories of intentional control: The importance of goals	235
Norman and Shallice's model of willed and automatic control of behaviour	237

Exploring the voluntary control of tasks	239
Task switching: A PDP model	248
Summary	251
Further reading	253
9. The nature and function of consciousness	255
Attention and consciousness	255
Evidence from normal subjects	256
The question of thresholds	262
Inattentional blindness	266
Change blindness	268
Differences between conscious and unconscious processing	270
The mind's best trick?	280
But what is consciousness?	283
The conscious/unconscious distinction	288
Summary	291
Further reading	292
References	295
Author index	323
Subject index	331

List of figures

- 2.1. Flow of information within the nervous system 21
Source: Broadbent 1971
- 2.2. Modified theory of attention introduced by Treisman 26
Source: Treisman 1960
- 2.3. Diagram of the sort used by Sperling 1960 29
Source: Sperling 1960
- 2.4. Schematic description of results from a partial report experiment, showing partial report superiority and loss of advantage as stimulus-cue interval increases 30
Source: Humphreys and Bruce 1989
- 2.5. Examples of stimuli used by Styles and Allport 1986 33
Source: Styles and Allport 1986
- 3.1. Response times to visual targets according to likelihood of a spatial cue indicating target's spatial location correctly 54
- 3.2. Examples of compound figures with local and global properties 66
- 3.3.
 - a. Copying performance of a flower and spontaneous drawing of a clock that a typical neglect patient might produce 69
 - b. Idealised performance of a neglect patient on the lines cancellation test 69
- 3.4. Stimuli used by Driver and Halligan 1991 74
 - a. Object-centred axis and midline are identical and confounded 74
 - b. Feature distinguishing the two shapes lies to the left of the object-centred axis but to right of midline 74
Source: Driver and Halligan 1991
- 4.1. Framework proposed to account for the role of selective attention if feature integration 90
Source: Treisman 1988
- 4.2. Typical performance in a detection task plotting response time to detect a target as a function of target definition (conjunctive versus single feature) and display size 91
- 4.3. Four forms of attentional selection mediated by interactions between location map, feature maps, an object file and a late

- section stage determining which objects should control response 97
Source: Treisman 1993
- 4.4. Schematic view of SLAM for the modelling of filtering tasks 104
Source: Phaf et al. 1990
- 4.5. Basic architecture of SERR 106
Source: Humphreys and Muller 1993
- 5.1. Percentage correct detection as a function of signal frequency 123
Source: Scharf 1998
- 5.2. Schematic of the soundfield used in Abrogast and Kidd 2000 127
Source: Abrogast and Kidd 2000
- 5.3. Schematic view of position of possible target loudspeakers and target lights, plus central fixation lights in Spence and Driver's (1996, 1997) studies of audiovisual links in covert spatial attention 137
- 5.4. Relative hand position in a uncrossed condition and b crossed condition in a visual-tactile or tactile-visual cueing experiment 140
- 5.5. Schematic illustration of apparatus used by Driver 1996 144
Source: Driver 1996
- 6.1. Performance resource functions for tasks differing in practice or difficulty 158
Source: Wickens 1984
- 6.2. Performance operating characteristic representation of (A) a case in which resources from a secondary task on the abscissa can compensate for difficulty changes in the primary task on the ordinate and (B) a case in which reallocation is not possible 160
Source: Wickens 1984
- 6.3. A typical PRP procedure 164
- 7.1. Network architecture for the model of the Stroop task 196
Source: Cohen and Huston 1994
- 7.2. Overview of the ACT* cognitive architecture 205
Source: Anderson 1983
- 8.1. The Norman and Shallice model 238
Source: Norman and Shallice 1986
- 8.2. Examples of mixed and uniform lists of the type used by Allport et al. 1994 241
Source: Allport et al. 1994
- 8.3. Architecture of Gilbert and Shallice's (2002) PDP model of task switching 249
Source: Gilbert and Shallice 2002
- 9.1. Experience of conscious will, according to Wegner 2003 281
Source: Wegner 2003
