Contents

Chapter I. Classical Mathematical Theory

I.1. Terminology 1
I.2. The Oldest Differential Equations 4
Newton 4
Leibniz 6
Variational Calculus 7
Clairaut 8
I.3. Equations Solvable by Quadrature and Elementary Functions 10
Equation with separable variables 10
Inhomogeneous linear equation 10
Total differential equations 10
Second order equations 11
Exercises 12
I.4. Linear Differential Equations 15
Equations with constant coefficients 15
Variation of constants 17
Exercises 18
I.5. Equations with Weak Singularities 20
Linear equations 20
Nonlinear equations 22
Exercises 23
I.6. Systems of Equations 25
Lagrange 25
Fourier 28
Exercises 29
I.7. A General Existence Theorem 31
Convergence of Euler's method 31
Existence theorem of Peano 37
Exercises 39
I.8. Existence Theory Using Iteration Methods and Taylor Series 41
Picard iteration 42
Taylor series 43
Convergence proof 44
Recursive computation of Taylor coefficients 45
Exercises 47
I.9. Existence Theory for Systems of Equations 49
Vector notation 50
Subordinate matrix norms 51
Picard iteration for systems 52
Exercises 53
I.10. Differential Inequalities 54
Introduction 54

The fundamental theorems 55
Estimations using one-sided Lipschitz conditions 58
Exercises 61
I.11. Systems of Linear Differential Equations 63
The Wronskian 64
The Abel-Liouville-Jacobi-Ostrogradskii identity 65
Inhomogeneous linear equations 66
Exercises 66
I.12. Systems with Constant Coefficients 69
Linearization 69
Diagonalization 69
The Schur decomposition 70
Numerical computations 72
The Jordan canonical form 74
Geometric representation 77
Exercises 78
I.13. Stability 81
Introduction 81
The Routh-Hurwitz criterion 82
Computational considerations 86
Liapunov functions 87
Stability of nonlinear systems 89
Stability of non-autonomous systems 90
Exercises 91
I.14. Derivatives with Respect to Parameters and Initial Values 94
The derivative with respect to a parameter 95
Derivatives with respect to initial values 97
The nonlinear variation-of-constants formula 98
Exercises 100
I.15. Boundary Value and Eigenvalue Problems 101
Boundary value problems 101
Sturm-Liouville eigenvalue problems 103
Exercises 106
I.16. Periodic Solutions, Limit Cycles, Strange Attractors 107
Van der Pol's equation 107
Existence proof (Poincaré sections) 107
Steady-state approximations for ϵ large 109
Asymptotic solutions for ϵ small 110
Chemical reactions (The Brusselator) 111
Limit cycles in higher dimensions, Hopf bifurcation 113
Strange attractors 117
Feigenbaum cascades 121
Exercises 123

Chapter II. Runge-Kutta and Extrapolation Methods

II.1. The First Runge-Kutta Methods 130
General formulation of Runge-Kutta methods 132
Discussion of methods of order 4 133

"Optimal" formulas 137
Numerical example 139
Exercises 140

II.2. Order Conditions for RK Methods 142
The derivatives of the true solution 144
Conditions for order 3 144
Trees and elementary differentials 144
The Taylor expansion of the true solution 146
Faà di Bruno's formula 148
The derivatives of the numerical solution 150
The order conditions 153
Exercises 154

II.3. Error Estimation and Convergence for RK Methods 156
Rigorous error bounds 156
The principal error term 158
Estimation of the global error 159
Exercises 163

II.4. Practical Error Estimation and Step Size Selection 165
Richardson extrapolation 165
Automatic step size control 166
Embedded RK formulas 167
The formula of Dormand and Prince 171
Numerical study of the step-control mechanism 172
Numerical comparison of 4th-order methods 174
Exercises 174

II.5. Further Questions of Practical Computation 176
Dense output 176
Continuous embedded formulas 179
Implicit output 180
Discontinuous equations 180
Starting step-size 182
Numerical computation of derivatives with respect to initial values and parameters 183
Exercises 184

II.6. Explicit RK-Methods of Higher Order 185
The Butcher barriers 185
6 stage, 5th order processes 186
7 stage, 6th order processes 188
Further Butcher barriers 189
A 10-th order formula 189
Embedded formulas of high order 193
A numerical example 196
Exercises 196

II.7. Implicit Runge-Kutta Methods 199
Introduction 199
Existence of numerical solution 201
The methods of Kuntzmann and Butcher of order $2s$ 203
IRK methods based on Lobatto quadrature 204
IRK as collocation methods 206
Exercises 209

II.8. Asymptotic Expansion of the Global Error 211
The local error 211
The global error 211
Examples 213
Variable h 213
Negative h 214
Properties of the adjoint method 215
Symmetric methods 216
Exercises 217

II.9. Extrapolation Methods 219
Definition of the method 219
The Aitken-Neville algorithm 221
Rational extrapolation 221
A numerical example 222
Extrapolation with symmetric methods 223
The Gragg or GBS method 224
The smoothing step 225
Numerical algorithm and example 226
Asymptotic expansion for odd indices 226
Existence of explicit RK methods of arbitrary order 228
Order and step size control 228
Numerical study of the combined step size and order control 231
Exercises 232

II.10. Numerical Comparisons 236
Numerical results 238
A discontinuous example 239
Conclusion 241

II.11. Composition of B-Series 242
Composition of RK methods 242
B-series 243
Order conditions for RK methods 247
Butcher's "effective order" 247
Exercises 248

II.12. Higher Derivative Methods 250
Collocation methods 251
Obreschkoff methods 253
Fehlberg methods 254
General theory of order conditions 256
Exercises 258

II.13. Numerical Methods for Second Order Differential Equations 260
Nyström methods 261
The derivatives of the exact solution 262
The derivatives of the numerical solution 265
The order conditions 267
On the construction of Nyström methods 268
Global convergence 270
Implementation of Nyström methods 271
An extrapolation method for $y''=f(x,y)$ 271
Numerical comparisons 273
Higher order systems 274
Exercises 275

II.14. P-Series for Partitioned Ordinary Differential Equations 276
Derivatives of the exact solution, P-trees 277
P-series 280
RK-methods violating (1.9) 282
Fehlberg methods 283
Nyström methods 283
Exercises 285
II.15. Delay Differential Equations 286
Existence 286
Constant step size methods for constant delay 288
Variable step size methods 289
Characteristic values of exponential solutions 290
Stability 291
An example from population dynamics 292
Infectious disease modelling 294
An example from enzyme kinetics 295
A mathematical model in immunology 297
Integro-differential equations 299
Exercises 300

Chapter III. Multistep Methods and General Linear Methods

III.1. Classical Linear Multistep Formulas 304
Explicit Adams methods 305
Implicit Adams methods 306
Recurrence relations for the γ_i 308
Explicit Nyström methods 309
Milne-Simpson methods 310
Methods based on differentiation (BDF) 311
Exercises 313
III.2. Local Error and Order Conditions 315
Local error of a multistep method 315
The order of a multistep method 317
The error constant of a multistep method 319
Irreducible methods 321
The Peano kernel of a multistep method 322
Exercises 324
III.3. Stability and the First Dahlquist Barrier 326
Stability of the BDF-formulas 328
Highest attainable order of stable multistep methods 331
Exercises 335
III.4. Convergence of Multistep Methods 340
Formulation as one-step method 342
Proof of convergence 344
Exercises 345
III.5. Variable Step Size Multistep Methods 347
Variable step size Adams methods 347
Recurrence relations $g_j(n)$, $\Phi_j(n)$ and $\Phi_j^*(n)$ 349
Variable step size BDF-formulas 350

General variable step size methods and their order 351
Stability 352
Convergence 357
Exercises 359

III.6. Nordsieck Methods 360
Equivalence with multistep methods 363
Implicit Adams methods 368
BDF-methods 369
Exercises 370

III.7. Implementation and Numerical Comparisons 372
Step size and order selection 372
Some available codes 374
Numerical comparisons 378
A partial differential equation 381

III.8. General Linear Methods 385
A general integration procedure 386
Examples of method (8.4) 386
Stability and order 391
Convergence 394
Order conditions for general linear methods 396
Construction of general linear methods 399
Exercises 401

III.9. Asymptotic Expansion of the Global Error 403
An instructive example 403
Asymptotic expansion for strictly stable methods (8.4) 405
Weakly stable methods 409
The adjoint method 412
Symmetric methods 415
Exercises 416

III.10. Multistep Methods for Second Order Differential Equations 418
The first methods 419
Störmer's problem 420
Higher order methods 421
General formulation 424
The stability condition 424
A one-step formulation of method (10.19) 425
Consistency and convergence 426
Asymptotic formula for the global error 428
An order barrier for stable methods (10.19) 429
Rounding errors 430
Exercises 430

Appendix. Fortran Codes

1. Dopri5 433
2. Dopri8 435
3. Odex 440
4. Odex2 443

5. Doprin 447
6. Retard, Store and Ylag 450
