Contents

1 Introduction **1**

1.1 Airline Planning and Crew Management 3

1.2 Crew Disruption Management in Airlines 6

1.3 Decision Support in Airline Crew Management 8

1.4 Organization of the Thesis 10

2 The Airline Crew Recovery Problem **11**

2.1 Problem Environment 12

2.1.1 The Planning Process as Basis for Operations 13

2.1.2 The Recovery Process at Operations Time 16

2.2 The Structure of the Recovery Problem 19

2.2.1 Resources Involved 19

2.2.2 Activities of Cockpit Crews 20

2.2.3 Constraints 21

2.2.4 Disruption Scenarios 23

2.2.5 Disrupted and Recovery Period 26

2.2.6 Cost Structure 27

2.3 General Problem Objectives 28

2.3.1 Minimization of Additional Cost 28

2.3.2 Solution Time Restriction 29

2.3.3 Crew Disturbance Reduction 29

2.4 Crew Recovery in Practice 30

2.5 Test Instances 33

3 Literature Review **35**
3.1 Review of the Airline Crew Scheduling 36
3.1.1 The Airline Crew Pairing Problem 38
3.1.1.1 Problem Formulations 38
3.1.1.2 Solution Approaches 40
3.1.2 The Airline Crew Assignment Problem 45
3.1.2.1 Characteristics of the Crew Assignment Problem 45
3.1.2.2 Problem Formulations 47
3.1.2.3 Solution Approaches 49
3.1.3 Integrated Airline Crew Scheduling 51
3.2 Review of the Airline Crew Recovery 52
3.2.1 Problem Formulations 53
3.2.2 Solution Methods 54
3.3 Summary 57

4 Mathematical Programming and Optimal Recovery Solution **59**
4.1 General Requirements 59
4.1.1 Cost Minimization 60
4.1.1.1 Operational Cost 60
4.1.1.2 Cost For Using Standby/Reserve Crew 62
4.1.1.3 Change Cost 62
4.1.2 Recovery Period 65
4.1.3 Active and Frozen Flights 66
4.1.4 Decomposition 67
4.2 Set Partitioning Models for Airline Crew Recovery 68
4.2.1 Basic Model 68
4.2.2 Revised Model 70
4.3 Model Solving 72
4.3.1 Network Representation 72
4.3.2 Problem Solved as an Integer Model 74
4.3.3 A Column Generation Approach 75
4.3.3.1 Master Problem 78
4.3.3.2 Initialization 79

4.3.3.3 Subproblem 82
4.4 Computational Experiences 85
4.5 Summary 88

5 Heuristics for Airline Crew Recovery **91**
5.1 A Genetic Algorithm for the Airline Crew Recovery Problem . . . 93
5.1.1 Two Dimensional Representation 94
5.1.1.1 Matrix Encoding Scheme 94
5.1.1.2 Constraints Consideration in the Matrix Encoding 95
5.1.2 Population Initialization 96
5.1.3 Variation Operators 97
5.1.3.1 Crossovers 98
5.1.3.2 Mutations 99
5.1.4 Evaluation 101
5.1.5 Feasibility Maintenance 103
5.1.6 Selection Method 104
5.1.7 Replacement Strategy 105
5.1.8 Computational Results 106
5.2 Constructive Heuristics 112
5.2.1 Multi-weight based Greedy Heuristics for Crew Assignment 112
5.2.2 Application for Crew Recovery 114
5.3 Comparison of Solution methods 117

6 Disruption Classification and Strategy Mapping **119**
6.1 Disruption Classification 120
6.2 Strategy Mapping 122
6.2.1 Basis of the Analytic Hierarchy Process 122
6.2.2 Criteria in the Airline Crew Recovery Problem 124
6.2.3 Solution Strategies 125
6.2.4 Strategy Mapping Process 127
6.3 Case Study 127
6.4 Summary 130

7 A Decision Support System for the Airline Crew Recovery 131
7.1 What Can a DSS bring to the Airline Crew Management? 132
7.2 Requirements for Decision Support Systems 134
7.3 A Dedicated Decision Support System Architecture 138
7.3.1 Users and User Interface 138
7.3.2 Core Components 140
7.3.3 Data 141
7.4 Crew Recovery Process Flow 142
7.5 Summary 145

8 Conclusions and Future Research 147

References 165

List of Figures

1.1 Crew management in airline schedule planning process 4

2.1 An example of crew pairing 14
2.2 Airline crew scheduling process 15
2.3 Airline crew recovery process 16
2.4 Resources involved in the recovery process 20
2.5 Disrupted and recovery periods 26
2.6 Operations recovery 30

3.1 Airline crew scheduling approaches 37

4.1 Active and frozen flight legs 67
4.2 Sample multi-layer network G' 73
4.3 Network structure 73
4.4 The reduction of the network 83
4.5 The effect of the number of columns generated during each iteration to the number of iterations 87
4.6 The effect of the number of columns generated during each iteration to the total solution time 87

5.1 Two-dimensional representation 94
5.2 *Row-based crossover* operator 98
5.3 *Column-based crossover* operator 99
5.4 Mutation operators 100
5.5 Effect of the population size 107
5.6 Comparison between using and not using local improvement . . . 108

5.7 The performance of crossover operators on different instances (1) . 109
5.8 The performance of crossover operators on different instances (2) . 110
5.9 Multi-weight based assignment heuristic 113

6.1 A sample AHP hierarchy for strategy mapping, with 5 criteria and n strategies 128

7.1 The general structure of a DSS 133
7.2 The system architecture of the DSS 139
7.3 General crew recovery process flow 143
7.4 DSS configuration for the crew recovery process 144

List of Tables

2.1 Comparison between CSP and CRP 18

4.1 Overview of the problem instances 86
4.2 Disruption scenarios based on instances A3 and B1 86
4.3 Computational performance between enumeration based approach and column generation approach 88

5.1 Disruption scenarios 106
5.2 The performance of different crossover operators 111

6.1 Example strategies for solving the airline crew recovery problem . 126
6.2 Pairwise comparison matrix of criteria 129
6.3 Pairwise comparison matrix of strategies on the criteron AC . . . 129
6.4 Pairwise comparison matrix of strategies on the criteron ST . . . 129
6.5 Pairwise comparison matrix of strategies on the criteron N 130

7.1 DSS functionality for the airline crew scheduling and recovery . . 136
