0	Introduction	1
0.1	Lower Complexity Bounds	1
0.2	Complexity Theory in Geometry and Topology	8
0.3	Outline	18
0.4	Credits	18
I	Lower Bounds on the Complexity of Bilinear Maps	21
1	Preliminaries I	23
1.1	The Model of Computation	23
1.2	Singular Values and Matrix Rigidity	25
1.3	Complex Gaussian Vectors	26
1.4	Bounding Large Deviations	27
1.5	Two Useful Inequalities	28
2	Lower Bounds for Linear and Bilinear Maps	29
2.1	The Mean Square Volume Bound	29
2.2	A Lower Bound on Cyclic Convolution	31
2.3	An Alternative to Lemma 2.6 (after Raz)	36
2.4	Multiplication and Division of Polynomials	38
3	Unbounded Scalar Multiplications	41
3.1	Extension of the Mean Square Volume Bound	41
3.2	Extremal Values of Gaussian Random Vectors	42
3.3	Cyclic Convolution and Help Gates	43
II	Computational Complexity of Euler Characteristics	47
4	Preliminaries II	49
4.1	Algebraic Geometry	49
4.2	Algebraic Topology	51
4.3	Transversality	52

4.4	Model of Computation and Complexity	53
5	Counting Complexity Theory	63
5.1	Counting Complexity Classes	63
5.2	Generic Parsimonious Reductions	66
5.3	Boolean Parts of Complexity Classes	72
6	Topological Euler Characteristic	77
6.1	Projective Degrees and Euler Characteristics	78
6.2	Computing Projective Degrees	81
6.3	Complexity of the Euler Characteristic	83
6.4	Expressing Transversality	85
6.5	Proof of Proposition 6.3	87
7	Hilbert Polynomial	91
7.1	Statement of Results	91
7.2	Projective Characters	93
7.3	The Hilbert Polynomial and Projective Characters	99
7.4	Complexity of the Hilbert Polynomial	100
7.5	Expressing Transversality	106
8	Hilbert Polynomial and Degeneracy Loci	111
8.1	Singular Homology Theory	111
8.2	Chern Classes and Riemann-Roch	113
8.3	Symmetric Functions	115
8.4	Proof of Theorem 7.13	117
