

TABLE OF CONTENTS

	page
Preface	5
I. CO ₂ Increase in the Atmosphere and the Role of the Carbon Cycle	11
1. The CO ₂ /climate problem	11
2. Assessing past CO ₂ levels	11
2.1 Analysis of tree ring samples	11
2.2 Analysis of ice core samples	12
2.3 Instrumental record of atmospheric CO ₂ trends	13
2.4 Global measurement program	15
3. Effects on the carbon cycle	16
3.1 Role of fossil fuels	16
3.2 Role of the biosphere	17
3.3 Role of the oceans	21
3.4 The global carbon cycle	23
4. Modeling the carbon cycle	26
4.1 Box models	26
4.2 Box diffusion models	27
4.3 Advective-diffusive models	27
4.4 Multi-box models	27
5. Assessing future CO ₂ levels	28
5.1 Effective airborne fraction	28
5.2 Range of future CO ₂ developments	28
5.3 CO ₂ emission and concentration levels resulting from selected energy scenarios	29
5.4 Long-term CO ₂ developments	31
II. Response of Climate Models to a CO ₂ Increase	32
1. Introduction	32
2. Climate model simulations for a CO ₂ increase: The equilibrium response	32
2.1 Radiative-convective models	32
2.1.1 Model description	32
2.1.2 Model variables	33
2.1.3 Model validation and model response to a CO ₂ doubling	35
2.1.4 One-dimensional model response to a CO ₂ doubling for different conditions in the earth-atmosphere system	35
2.1.5 Discussion	40
2.2 Energy balance models	40
2.2.1 Model description	40
2.2.2 Model variables	40
2.2.3 Model validation and response to a CO ₂ doubling	41

	page
2.2.4 Zonally-averaged model response to a CO ₂ doubling for different atmospheric conditions in the earth-atmosphere system	42
2.2.5 Discussion	44
2.3 General circulation models	45
2.3.1 Model description	45
2.3.2 Model characteristics	46
2.3.3 Model validation	50
2.3.4 Model simulations for a CO ₂ increase	52
2.4 The statistical significance of climate model results	55
2.4.1 Introduction	55
2.4.2 The method of Katz	56
2.4.3 The method of Chervin	56
2.4.4 The method of Hayashi	59
3. Climate model simulations for a CO ₂ increase: The transient response	59
3.1 Introduction	59
3.2 Horizontally-averaged transient response	59
3.3 Latitudinal transient response	61
4. Detection of a CO ₂ signal	61
4.1 Introduction	61
4.2 Statistical methods	61
4.3 Deterministic methods	62
5. Summary of climate model results	64
III. Development of Regional Climate Scenarios	65
1. Definition	65
2. Methodology for the development of climate scenarios	65
3. Use of analog studies in impact analysis	67
3.1 Paleoclimatic data	67
3.2 Historical data	68
3.2.1 Comparison of warm and cold periods	68
3.2.2 Similarity method for analysing climatic fluctuations	72
3.3 Comments on the use of analog studies	73
4. Use of climate models in impact analysis	73
4.1 Model requirements for impact analysis	73
4.1.1 Model characteristics	75
4.1.2 Model performance	75
4.2 Data processing	76
4.2.1 Processing of GCM-generated data	76
4.2.2 Calculation of statistical parameters	77
4.2.3 Calculation of the parameters used for pattern comparison	77

	9
	page
4.3 Model verification	77
4.3.1 Verification of the temperature and precipitation rate distributions for the GISS control experiment	79
4.3.2 Verification of the temperature and precipitation rate distributions for the BMO control experiment	79
4.4 Climate change scenarios for the study area	80
4.4.1 Longitudinally-averaged distributions	80
4.4.2 Regional distributions	86
4.4.3 Pattern comparison	93
4.4.4 Comparison of the model scenarios	99
5. Comparison of analog and model scenarios	104
6. Summary and concluding remarks	105
7. Zusammenfassung	106
References	108
