CONTENTS

1 INTRODUCTION TO BASIC CONCEPTS IN EXPERIMENTAL DESIGN

1.1	Introduction	1
1.2	Formulation of Plans for Collection and Analysis of Data	3
1.3	Overview of Types of Experimental Designs	8
1.4	Threats to Valid Inference-Making	20
1.5	Ethical Treatment of Research Subjects	24
1.6	Review of Statistical Inference	25
1.7	Review Exercises	44

2 FUNDAMENTAL ASSUMPTIONS IN ANALYSIS OF VARIANCE

2.1	Basic Sampling Distributions in Analysis of Variance	49
2.2	Partition of Total Sum of Squares	57
2.3	Expectation of Mean Squares	64
2.4	The F Ratio in Analysis of Variance	73
2.5	Effects of Failure to Meet Assumptions in Analysis of Variance	74
2.6	Transformations	79
2.7	Review Exercises	85

3 MULTIPLE COMPARISON TESTS

3.1	Introduction to Multiple Comparison Tests	90
3.2	A Priori Orthogonal Contrasts	95
3.3	Conceptual Unit for Error Rate	101
3.4	A Priori Nonorthogonal Contrasts	106
3.5	A Posteriori Nonorthogonal Contrasts	114
3.6	Comparison of Multiple Comparison Procedures	127
3.7	Review Exercises	127

4 COMPLETELY RANDOMIZED DESIGN

4.1	Description of Design	134
4.2	Exploratory Data Analysis	135
4.3	Computational Example for a Type CR-p Design	139
4.4	Procedures for Testing Differences Among Means	146
4.5	Tests for Trends in the Data	149
4.6	Measures of Association	161
4.7	Random-Effects Model	163
4.8	Advantages and Disadvantages of Type CR-p Design	165
4.9	Review Exercises	165

5 GENERAL LINEAR MODEL APPROACH TO ANOVA

5.1	Introduction to the General Linear Model	171
5.2	Estimating Parameters in the General Linear Regression Model	178
5.3	Regression Model Approach to ANOVA	184
5.4	ANOVA Via the Regression Model Approach With Dummy Coding	187
5.5	Alternative Conception of the Test of $\beta_1 = \beta_2 = \cdots = \beta_{h-1} = 0$	192
5.6	Testing Differences Among Means Using the Regression Model Approach	195
5.7	ANOVA Via the Regression Model Approach With Effect and Orthogonal Coding	199
5.8	Experimental Design Model Approach to ANOVA	208
5.9	ANOVA Via the Less Than Full Rank Experimental Design Model Approach	211
5.10	ANOVA Via the Full Rank Experimental Design Model Approach	225
5.11	Summary	229
5.12	Review Exercises	230

6 RANDOMIZED BLOCK DESIGNS

6.1	Description of the Randomized Block Design	237
6.2	Computational Example for a Type RB-p Design	243
6.3	Alternative Models for a Type RB-p Design	247
6.4	Some Assumptions Underlying a Type RB-p Design	253
6.5	Procedures for Testing Differences Among Means	263
6.6	Tests for Trends in the Data	266
6.7	Estimating Missing Observations	268
6.8	Relative Efficiency of Randomized Block Design	271
6.9	General Linear Model Approach to Type RB-p Design	273
6.10	Generalized Randomized Block Design	293
6.11	Advantages and Disadvantages of Type RB-p and GRB-p Designs	297
6.12	Review Exercises	298

7 LATIN SQUARE AND RELATED DESIGNS

7.1	Description of Latin Square Design	308
7.2	Construction and Randomization of Latin Squares	309
7.3	Computational Example for Type LS-p Design	312
7.4	Computational Procedures for $n = 1$	318
7.5	Experimental Design Model for a Type LS-p Design	319
7.6	Procedures for Testing Differences Among Means	322
7.7	Estimating Missing Observations	323
7.8	Relative Efficiency of Latin Square Design with $n = 1$	326
7.9	General Linear Model Approach to Type LS-p Design	329
7.10	Graeco-Latin Square Design	339
7.11	Hyper-Graeco-Latin Square Designs	341
7.12	Advantages and Disadvantages of Type LS-p Design	342
7.13	Review Exercises	342

8 COMPLETELY RANDOMIZED FACTORIAL DESIGN WITH TWO TREATMENTS

8.1	Introduction to Factorial Experiments	350
8.2	Description of Completely Randomized Factorial Design	351
8.3	Computational Example for Type CRF-pq Design	353
8.4	Experimental Design Model for a Type CRF-pq Design	359
8.5	Procedures for Testing Differences Among Means	364

8.6	More on the Interpretation of Interactions	365
8.7	Test for Trends in the Data	379
8.8	Estimating Strength of Association in a Type CRF-*pq* Design	387
8.9	Rules for Deriving Expected Values of Mean Squares	389
8.10	Quasi *F* Ratios	394
8.11	Preliminary Tests on the Model and Pooling Procedures	396
8.12	The Analysis of Completely Randomized Factorial Designs With $n = 1$	399
8.13	Analysis of Completely Randomized Factorial Designs With Unequal Cell n's	401
8.14	Advantages and Disadvantages of Factorial Designs	422
8.15	Review Exercises	423

9 COMPLETELY RANDOMIZED FACTORIAL DESIGN WITH THREE OR MORE TREATMENTS AND RANDOMIZED BLOCK FACTORIAL DESIGN

9.1	Introduction to Type CRF-*pqr* Design	429
9.2	Computational Example for Type CRF-*pqr* Design	431
9.3	Patterns Underlying Computational Formulas for Type CRF Designs	435
9.4	Introduction to Randomized Block Factorial Design	441
9.5	Computational Example for a Type RBF-*pq* Design	443
9.6	Expected Value of Mean Squares and the Circularity Assumption	446
9.7	Analysis of Randomized Block Design With Missing Observations	449
9.8	Minimizing Time and Location Effects by the Use of a Randomized Block Factorial Design	453
9.9	Review Exercises	453

10 HIERARCHICAL DESIGNS

10.1	Introduction to Hierarchical Designs	456
10.2	Computational Example for Type CRH-*pq*(*A*) Design	459
10.3	Experimental Design Model for a Type CRH-*pq*(*A*) Design	464
10.4	Procedures for Testing Differences Among Means	466
10.5	Estimating Strength of Association in a Type CRH-*pq*(*A*) Design	467
10.6	Description of Other Completely Randomized Hierarchical Designs	468
10.7	Analyzing Hierarchical Designs Using Computer Programs for Crossed Treatments	479
10.8	Analysis of Unbalanced Hierarchical Designs	480
10.9	Advantages and Disadvantages of Hierarchical Designs	483
10.10	Review Exercises	484

11 SPLIT-PLOT FACTORIAL DESIGN: DESIGN WITH GROUP-TREATMENT CONFOUNDING

11.1	Introduction to Split-Plot Factorial Design	489
11.2	Computational Example for Type SPF-$p \cdot q$ Design	492
11.3	Experimental Design Model for a Type SPF-$p \cdot q$ Design	493
11.4	Some Assumptions Underlying a Type SPF-$p \cdot q$ Design	500
11.5	Procedures for Testing Hypotheses About Means	505
11.6	Procedures for Testing Hypotheses About Simple Main Effects and Treatment-Contrast Interactions	510
11.7	Test for Trends in a Type SPF-$p \cdot q$ Design	513
11.8	Relative Efficiency of Split-Plot Factorial Design	519
11.9	Introduction to Type SPF-$pr \cdot q$ Design	523
11.10	Computational Procedures for Type SPF-$prt \cdot q$ Design	531
11.11	Computational Procedures for Type SPF-$p \cdot qr$ Design	535
11.12	Computational Procedures for Type SPF-$p \cdot qrt$ Design	544
11.13	Computational Procedures for Type SPF-$pr \cdot qt$ Design	547
11.14	Evaluation of Sequence Effects	549
11.15	Analysis of a Type SPF-$p \cdot q$ Design Using the Full Rank Model Approach	550
11.16	Advantages and Disadvantages of Split-Plot Factorial Designs	564
11.17	Review Exercises	564

12 CONFOUNDED FACTORIAL DESIGNS: DESIGNS WITH GROUP-INTERACTION CONFOUNDING

12.1	Introduction to Confounding in Factorial Experiments	570
12.2	Use of Modular Arithmetric in Constructing Confounded Designs	573
12.3	Computational Procedures for Type RBCF-2^2 Design	577
12.4	Experimental Design Model for a Type RBCF-2^2 Design	579
12.5	Layout and Analysis for a Type RBCF-2^3 Design	583
12.6	Complete Versus Partial Confounding	590
12.7	Computational Procedures for Type RBPF-2^3 Design	591
12.8	Computational Procedures for Type RBCF-3^2 and RBPF-3^2 Designs	601
12.9	Analysis Procedures for Higher-Order Confounded Designs	613
12.10	Alternative Notation and Computational Systems	626
12.11	Computational Procedures for Type RBPF-32^2 Design	627
12.12	Analysis of Confounded Factorial Designs Using the Full Rank Model Approach	637
12.13	Group-Interaction Confounding by Means of a Latin Square	648
12.14	Double Confounding	656
12.15	Advantages and Disadvantages of Confounding in Factorial Designs	656
12.16	Review Exercises	658

13 FRACTIONAL FACTORIAL DESIGNS: DESIGNS WITH TREATMENT-INTERACTION CONFOUNDING

13.1	Introduction to Fractional Factorial Designs	664
13.2	General Procedures for Constructing Type CRFF-2^k Designs	666
13.3	Computational Procedures for Type CRFF-2^4 Design	669
13.4	Computational Procedures for Type CRFF-3^4 Design	674
13.5	General Procedures for Constructing Type RBFF-2^k Design	680
13.6	Other Types of CRFF and RBFF Designs	681
13.7	Introduction to Latin Square Fractional Factorial Design	683
13.8	Computational Procedures for Type LSFF-$p \cdot p^2$ Design	685
13.9	Computational Procedures for Type LSFF-p^3t Design	687
13.10	Computational Procedures for Type LSFF-p^4u Design	696
13.11	Computational Procedures for Type GLSFF-p^3 Design	698
13.12	Analysis of Fractional Factorial Designs Using the Full Rank Model Approach	699
13.13	Advantages and Disadvantages of Fractional Factorial Designs	710
13.14	Review Exercises	711

14 ANALYSIS OF COVARIANCE

14.1	Introduction to Analysis of Covariance	715
14.2	Rationale Underlying Covariate Adjustment	720
14.3	Layout and Computational Procedures for Type CRAC-p Design	728
14.4	Assumptions of the Model for Type CRAC-p Design	731
14.5	Procedures for Testing Differences Among Means in Type CRAC-p Design	734
14.6	Analysis With Two Covariates	737
14.7	Analysis of Covariance for Randomized Block Design	740
14.8	Analysis of Covariance for Latin Square Design	743
14.9	Analysis of Covariance for Factorial Experiments	743
14.10	Covariance Versus Stratification	750

14.11 General Linear Model Approach to Type CRAC-p Design 753
14.12 Advantages and Disadvantages of Analysis of Covariance 755
14.13 Review Exercises 758
Appendix A Rules of Summation 763
Appendix B Rules of Expectation, Variance, and Covariance 768
Appendix C Orthogonal Coefficients for Unequal Intervals and Unequal n's 773
Appendix D Matrix Algebra 778
Appendix E Tables 806
Appendix F Answers to Starred Exercises 850
References 891
Index 905
