

Contents

1. INTRODUCTION AND BASIC CONCEPTS	3
1.1 Classification and cognition: an overview	4
1.1.1 Concepts and categories	4
1.1.2 Approaches to categorization: two theoretical traditions	5
1.1.3 Categorization and induction	8
1.1.4 Remarks on theoretical style	9
1.2 The array model framework	12
1.2.1 Representation: attributes, dimensions, and features	12
1.2.2 The problem of access to memory	14
1.2.3 Comparison and similarity	15
1.2.4 The product rule for patterns of binary-valued attributes	19
1.2.5 The core model for classification	27
Appendix 1.1 Union and intersection rules for computation of pattern similarity	28
Appendix 1.2 Attentional learning in the exemplar model	29
2. CATEGORY STRUCTURES AND CATEGORIZATION	32
2.1 Similarity in theories of classification	32
2.1.1 The core model applied to a natural category	32
2.1.2 From similarity to response probability	40
2.1.3 An alternative measure of similarity: the contrast model	41
2.2 Predicting categorization performance	44
2.2.1 The simplest categorization model in the array framework	45
2.2.2 On category structures and conceptual levels	56
3. MODELS FOR CATEGORY LEARNING	59
3.1 The exemplar-similarity model	59
3.1.1 Augmentations of the core model	59
3.1.2 Categorization and identification	66
3.1.3 Similarity and cognitive distance	68
3.1.4 Status of the exemplar-similarity model	71
3.2 Network-based learning models	72
3.2.1 A simple adaptive network model	72
3.2.2 The similarity-network model	75
3.2.3 Pattern to feature transfer	83
Appendix 3.1 Categorization probability for the exemplar model in relation to initial memory load	86

Appendix 3.2 Similarity-network output and learning functions for standard four-pattern categorization	87
Appendix 3.3 Additional details of Experiment 3.1 procedure	89
4. CATEGORIZATION AND MEMORY PROCESSING	90
4.1 Concurrent categorizations	90
4.2 Categorization with constraints on memory	97
4.2.1 Categorization with constrained repetition lags	98
4.2.2 Categorization based on short-term memory	100
4.2.3 Analyses of response frequency data	101
4.2.4 Analyses of reaction times	103
4.3 A modular view of exemplar and network models	106
Appendix 4.1 Method of Experiment 4.1	108
Appendix 4.2 Learning about invalid cues in concurrent categorizations: Experiment 4.2	112
Appendix 4.3 Method of Experiment 4.4: categorization in short-term memory	116
5. ON THE STORAGE AND RETRIEVAL OF CATEGORICAL INFORMATION	119
5.1 Standard versus observational training procedures	119
5.1.1 Method for comparison of training procedures	120
5.1.2 Results for comparisons of training procedures	122
5.2 Learning on the basis of average or configural prototypes	124
5.3 Inducing prototypes	128
5.4 Predicting features from categories	131
5.4.1 Feature-frequency estimates based on long-term memory	132
5.4.2 Feature-frequency estimates based on shorter-term memory	137
5.5 Pattern completion	142
Appendix 5.1 Induction of prototypes in a correlated-feature category structure: Experiment 5.1	144
Appendix 5.2 Induction of prototypes in an independent-feature category structure: Experiment 5.2	149
Appendix 5.3 Method and results of Gluck (1984) study	150
Appendix 5.4 Derivations of predictions from exemplar and similarity-network models for MacMillan (1987) study	151
6. EXTENSIONS AND NEW APPLICATIONS OF THE EXEMPLAR-SIMILARITY MODEL	156
6.1 Processing assumptions	157
6.2 Extensions and applications	159
6.2.1 Confusable categories	159
6.2.2 Transfer between categorizations	161

6.2.3	The burden of the past: interference in learning successive categorizations or discriminations	163
6.2.4	Learning multiple categorizations	166
6.2.5	Category learning in relation to number of categories	167
6.2.6	Effects of category size	171
6.2.7	Causal relations	174
6.2.8	The "dilution effect"	178
6.3	From categorization to recall	180
6.3.1	Simple cued recall of paired associates	180
6.3.2	Ordered recall	183
6.3.3	The crossover effect in sentence memory	189
6.3.4	Recall without response cueing	190
6.3.5	A comment on direct recall	192
6.4	On the extendability of the exemplar-similarity model	192
Appendix 6.1	Similarity computations for application of the array model to causal inference problems	193
7.	CATEGORIZATION AND RECOGNITION	194
7.1	Recognition: a window to memory?	194
7.1.1	Experimental paradigms	194
7.1.2	Aspects of recognition theory	196
7.2	Recognition in the array framework	197
7.2.1	Forced-choice recognition	197
7.2.2	Old/new recognition	204
7.2.3	The role of memory load in recognition	209
7.2.4	Effects of item repetition	211
7.2.5	Word-frequency and the "mirror effect"	217
7.3	Recognition in the similarity-network model	219
7.4	Short-term memory search	224
7.5	On recognition as a measure of memory	230
Appendix 7.1	Application of signal detectability theory to recognition	230
Appendix 7.2	Array-model computations for list-length/list-strength design in old/new recognition	232
Appendix 7.3	Summary of study of memory load in old/new recognition: Experiment 7.1	233
Appendix 7.4	Summary of repetition study: Experiment 7.2	235
8.	CATEGORIZATION AND COGNITION: REPRISE	238
8.1	The basis of classification in memory	238
8.1.1	The new faces of instance memory	238
8.1.2	Summary of the assumptions of the array-similarity model	239
8.2	Concepts and categories	241
8.3	The place of rules in a memory-based theory	244

8.4 Representation and structure	247
8.4.1 The issue of independence of attributes	248
8.4.2 Array versus network representations	249
8.5 Alternative theoretical approaches	254
8.5.1 The ACT framework	254
8.5.2 Hintzman's Minerva model	255
8.5.3 The general recognition model	255
8.5.4 Multilayer connectionist networks	256
8.5.5 On differential tests of models	256
