1	Introduction	1
2	Three Steps for the Analysis of Transinformation	8
2.1	Introduction	8
2.2	Methods	12
2.2.1	Step 1: Deterministic response model	13
2.2.2	Step 2: Coordinate transformation	16
2.2.3	Step 3: Transinformation based on signal-to-noise ratios	19
2.3	Results	22
2.4	Discussion	29
2.5	Appendix	37
2.5.1	Transinformation for AR noise signal and additive GWN	37
2.5.2	Transinformation for noise with distribution of sinusoid	38
2.5.3	Transinformation for random phase sinusoid	39
2.5.4	Transinformation for epoch aligned impulse response	40
2.5.5	Entropy estimation by means of density estimation	43
2.5.6	Decorrelation by means of PCA - an example	43
2.5.7	Relation between irrelevance and equivocation	44
2.5.8	Noise from two perspectives	45
2.5.9	Coherence and gain with regard to effective noise	45
3	Encoding of Stimulus Attributes	48
3.1	Introduction	48
3.2	Methods	50
3.3	Results	54
3.4	Discussion	58
4	Temporal, Spatial, and Intensity Resolution	62
4.1	Introduction	62
4.2	Methods	64
4.3	Results	70
4.3.1	Discrete stimulation	70
4.3.2	Continuous stimulation	81
4.4	Discussion	93

4.4.1	Temporal resolution	93
4.4.2	Intensity resolution	99
4.4.3	Spatial resolution	103
4.4.4	Conclusion	106
4.5	Appendix	108
4.5.1	Transinformation for discrete stimuli	108
4.5.2	Transinformation in case of identical stimuli	109
4.5.3	Decorrelation by means of Schmidt's orthogonalization	110
4.5.4	Spatially joint transinformation	110
5	Conclusion and Outlook	112
5.1	Summary of methods and results	112
5.2	A vision for blinds	113
5.3	Ethical remarks	114
A	Appendix	116
A.1	Lower bound of transinformation	116
A.2	Development of a laser projection device	117
A.3	Development of miniature current sources	117
	Bibliography	119
	Abbreviations	131
	Glossary	132
	Index	134
