

Contents

PART I The Classical Perspective

1. Why neural computing? A personal view
I. Aleksander 1
2. A theory of neural networks
E. Caianiello 8
3. Speech recognition based on topology-preserving neural maps
Teuvo Kohonen 26
4. Neural map applications
G. Tattershall 41
5. Backpropagation in non-feedforward networks
Luis B. Almeida 74
6. A PDP learning approach to natural language understanding
N. E. Sharkey 92
7. Learning capabilities of Boolean networks
Stefano Patarnello and Paolo Carnevali 117

PART II The Logical Perspective

8. The logic of connectionist systems
I. Aleksander 133
9. A probabilistic logic neuron network for associative learning
Wing-kay Kan and Igor Aleksander 156
10. Applications of N-tuple sampling and genetic algorithms to speech recognition
A. Badii, M. J. Binstead, Antonia J. Jones, T. J. Stonham and Christine L. Valenzuela 172
11. Dynamic behaviour of Boolean networks
D. Martland 217

PART III Analysis and Interpretation

12. Statistical mechanics and neural networks
C. Campell, D. Sherrington and K. Y. M. Wong 239
13. Digital neural networks, matched filters and optical implementations
J. E. Midwinter and D. R. Selviah 258
14. Hetero-associative networks using link-enabling vs. link-disabling local modification rules
Vernon G. Dobson, Alan Johnston and Michael J. Wright 279
15. Generation of movement trajectories in primates and robots
Rolf Eckmiller 305

PART IV The PDP Perspective

16. A review of parallel distributed processing
I. Aleksander 329
