NOTE BY THE EDITORS OF THE FIRST EDITION	xiii
NOTE BY THE EDITOR OF THE ENLARGED EDITION, 1959	xv
INTRODUCTION	1
The two traditional approaches	
Crucial difficulties	
Modern developments	
Chapter One. THE AREA OF THE PARALLELOGRAM	13
I. Pupils learn the solution; do the assigned tasks excellently	
Did they really understand? The psychologist puts a question	
Other tasks with A- and B-responses	
The method of A-B pairs	
An extreme case is considered	
What is the crucial issue?	
II. The psychologist introduces ugly procedures	
With the parallelogram	
A boy's induction plus proof	
A structurally blind hypothesis	
A crude example	
With the rectangle	
Confusion of area and perimeter	

A fantastic machine is considered

A queer procedure with proof

Essential characteristics of the ugly procedures

Certain objections are considered

III. Productive processes

Finding the area of the rectangle

Character of the operations

Remark on traditional view

Remark on relations

Remark on means-end formulations

On the meaning of multiplication

Finding the area of the parallelogram

Genuine productive processes in children

Character of the operations and of the processes

A remark on drill

Graphs of the sensible processes

Items involved. Dramatic transitions in thinking
as in perception

What is needed

IV. An easier way out? The role of past experience

A question left unanswered above

Remark of a logician; with an answer

And the goal itself?

Chapter Two. THE BRIDGE PROBLEM*

79

**Chapter Three. THE PROBLEM OF THE VERTICAL
ANGLES**

97

Difficulties in seeing the sense of the question

I. Reciting the proof—foolish mistakes and sensible
procedures

A- and B-tasks

II. Processes in finding the proof

III. Structural issues: structure of a pair of equations

Remark on a theoretical misformulation

Why the problem is so difficult

The line of thinking

IV. Remarks on a basically misleading traditional
assumption about the nature of human thinking

* All material marked with an asterisk appears for the first time in this edition.

- I. A problem for the reader
The story of young Gauss
Three types of productive processes in children
Differences and common features in the three types
- II. The psychologist comes to grips with the issues
Several structural issues
- III. Why is the task so difficult for many?
Factors working for and against productive solutions
Structural hiddenness
Structural simplification
Remark on doing and undoing
Digression on work and dance
The structural study goes on
Sensible tendencies in grouping
The square set in numbers and figures
Perception and reasonableness
Tasks with angles
- IV. The psychologist has strange experiences with structurally simplified tasks. Structural blindness
Remarks on the role of drill
Comments of a famous psychologist
Comments of a mathematician
Remarks of another psychologist
- V. Deepening the issue
A protocol of a thought process
First part
Second part
Remarks on whole-qualities
Third part
Problem with its solution only a part
A remark on exactness

**Chapter Seven. TWO BOYS PLAY BADMINTON; A
GIRL DESCRIBES HER OFFICE**

169

Brief review

- I. Story of the badminton game
 - Types of reaction to the problem
 - Continuation of the story: the boy's solution
 - Characterization of the steps and operations
 - On centering
 - On attitude
 - On transformation
 - A brief remark on great issues
- II. A girl describes her office. The Ego in the description
 - Discussion of the structure of the description
 - Relational networks
 - The source of the arrows
 - The hunch

**Chapter Eight. FINDING THE SUM OF THE ANGLES
OF A POLYGON**

193

The process starts
First hunch
The "intuition"
Remark on the usual formula
A queer idea
The internal angles. The hole
Solids?
Character of the process

Chapter Nine. A DISCOVERY BY GALILEO

205

- Introduction
The simplified situation
- I. What happens to the speed of moving bodies?
The order of accelerations
 - II. The other half of the picture
 - III. The gap. The discovery
Structural requirements vs. familiarity
The structural changes

- I. Act I. The beginning of the problem
- Act II. Light determines a state of absolute rest?
- Act III. Work on the one alternative
- Act IV. Michelson's result and Einstein
- Act V. The Lorentz solution
- Act VI. Re-examination of the theoretical situation
- Act VII. Positive steps toward clarification
Discovery of a gap
Consequences
- Act VIII. Invariants and transformation
- Act IX. On movement, on space, a thought experiment
- Act X. Questions for observation and experiment
- II. What were the decisive features in the thought process?
A remark on traditional interpretations
On the role of axioms
Survey of the line of thinking
The structural changes

**Conclusion: DYNAMICS AND LOGIC OF
PRODUCTIVE THINKING**

- Résumé
- Table of operations as envisaged by gestalt theory
- Three groups of problems
- Dynamic theory of thinking
- Two other types of processes
Their relation as to theory
- Ambiguity in the operations of the traditional approaches
- On gestalt logic
Remarks on "class" and on several basic operations of logic
- Direction in the process of thinking

Appendix 1. ON THE PROBLEM OF THE DISTINCTION BETWEEN ARBITRARY COMPONENT AND NECESSARY PART*	260
Appendix 2. THE ALTAR WINDOW*	266
Appendix 3. THE SCHOOL INSPECTOR*	269
Appendix 4. SUGGESTIONS FOR TEACHING ABOUT AREA*	272
Appendix 5. THE BALANCING STICK*	286
Appendix 6. THE SUM OF A SERIES	289
Appendix 7. MAX WERTHEIMER: A BIBLIOGRAPHY*	294
Index	297
