

CONTENTS

Foreword by John E. Horrocks	v
Preface	ix
Tables and Figures	xvii

Chapter One: The Scientific Goals of Ability Research

1. The importance of intelligence	1
2. A brief history of ideas about intelligence.	2
3. The testing age begins.	4
4. The basic issue of the structure and definition of abilities	7

Chapter Two: Principles and Methods in Investigating General Intelligence

1. The nature of verbal definitions of intelligence	11
2. Is intelligence unitary? Surface and source traits	13
3. Behavior structure investigation: from correlation to factor analysis.	16
4. The difference between the scientist's and the mathematician's factor model: rotational resolution	19
5. Early factor findings: the two-factor (<i>g</i> and <i>s</i>) hierarchical theory	22
6. A first glimpse of the properties of "general mental capacity"	24

Chapter Three: The Nature of Primary Abilities

1. From the general ability factor to multiple factor analysis	27
2. Thurstone demonstrates the existence of primary abilities	29
3. A roll call of presently recognized primary abilities	36
4. Description of some representative primary ability patterns	39

5. Fluency, memory, and perception primaries possibly tied to personality	46
6. Methods needed to clarify the primary ability field	51

Chapter Four: Principles in Drawing the Map of Abilities

1. What good is a taxonomy?	61
2. A critique and further exploration of some proposed classificatory principles	63
3. What categories are really needed in a theoretical classification of abilities?	70
4. The ADAC or theoretical “ability dimension analysis chart”	79
5. Constructing tests to fit a schema versus creating a taxonomy to fit discovered abilities	82

Chapter Five: The Discovery of Fluid and Crystallized General Intelligence

1. The birth of the “two intelligences” concept	87
2. The meaning of factor strata	95
3. Hyperplanes: the technical requirement for unambiguous factor resolution	101
4. The emergence of the second-stratum fluid and crystallized ability patterns	109
5. g_f and g_c : their differences from each other and from previous concepts	114

Chapter Six: Higher Stratum Ability Structure and the “Investment Theory” of Intelligence

1. What comes after the pyramids?	121
2. The interpretation of the main second-stratum broad factors	124
3. What can future research add to structural concepts at the second stratum?	128
4. The new perspective from the third stratum	133
5. Causal sequences and factor analysis: the investment theory	138
6. Problems of the autonomy and the Protean inconstancy of g_c	146

Chapter Seven: The Natural History of Ability: Distribution and Relation to Sex and Age

1. On the general ability equality of men and women	153
2. On the more specific ability differences and their subtle personality associations.	157
3. Intelligence changes in the growth period and the problem of intelligence units and distribution	163
4. Distribution problems connected with defining intelligence, especially in infancy.	174
5. Some problems in reaching meaningful trends and distributions in the adult period	186
6. Age changes in primary abilities and local organizations by SL, CL, and CCL methods	192
7. Age changes in intelligence and the general capacities	198

Chapter Eight: The Physiological and Neurological Bases of Intelligence

1. Ability and gross brain features	213
2. The degree of localization of brain function	215
3. Evidence for intelligence as generalized coordinated cortical action	219
4. Qualifications and complications of mass action theory	223
5. Evidence from electrical action of the brain.	226
6. Evidence from chemical response properties of the brain	236
7. The physiological interpretation of fluid and crystallized intelligence, qualified by some unsolved riddles of memory	244

Chapter Nine: Ultra-Human Intelligence: Illumination from Evolution of Animals and Machines

1. The distinction of intelligence as a subcategory within purpose-adaptive behavior	255
2. Instinct in relation to tractability and intelligence	257
3. The conditions and ranges of unreflective and insightful learning on animals.	261
4. Phylogenetic evidence on animal ability structure	269

5.	The general behavioral structure of mammalian ability . . .	277
6.	The comparative structure of the abilities of machines and computers	281

**Chapter Ten: The Debate on Heredity and Environment:
Abilities in Relation to Race and Culture**

1.	The need for scientific objectivity	305
2.	The Mendelian and the nature–nurture variance ratio approaches.	307
3.	Determining nature–nurture ratios: the MAVA method. . .	314
4.	Additional evidence from twin and family correlation studies	325
5.	The interplay of learning and school experience with the intelligence and primary abilities.	335
6.	The effects of specific differential experiences.	348
7.	Abilities as molded by race and culture	355

**Chapter Eleven: The Triadic Theory of Abilities Developmentally
Related to Structural Learning Theory**

1.	General introduction to theory.	365
2.	Clarification of power-agency and nature–nurture aspects of the triadic theory	367
3.	Closer consideration of properties of the sensory and motor organizations – the <i>p</i> 's	371
4.	The relations of general capacities (<i>g</i> 's), provincial organizations (<i>p</i> 's), and agencies (<i>a</i> 's).	379
5.	Agencies: (1) Tools or aids from cognitive consistencies: the transfer problem	384
6.	Agencies: (2) The effector patterns connected with dynamic structures, notably sentiments: the isomorphism principle	394
7.	Agencies: (3) Splitting effectors into proficiency and dynamic components by conditional factoring	402
8.	The formal equations concerning motivation and learning experience in relation to ability structure	409
9.	The distinction of developmental and action structures, and the changing pattern of crystallized intelligence	422

Chapter Twelve: Personality-Ability Interactions and the Prediction of Achievement

1. Basic principles in dissecting ability from personality and motivation traits	435
2. Personality traits that simulate abilities	442
3. What does intelligence do for personality development?	449
4. Personality and the special ability areas	456
5. Personality and ability measures in the prediction of achievement	462
6. Analysis of interaction of abilities, personality, and motivation in scholastic achievement	471
7. Memory, motivation, and ability.	483
8. The relation of motivation and ability to performance in an immediate situation	489

Chapter Thirteen: Genius and the Processes of Creative Thought

1. Some myths and facts about genius	499
2. Some ability and personality associates of high creativity	502
3. The creative personality and the culture pattern	512
4. The synthesis of capacities, personality, and dynamics in creativity.	519
5. The roles of g_f and a_g in problem-solving and creative process	524
6. The roles of educative, associative, and dissolvent thinking.	529
7. A closer look at crystallized intelligence in creative thought	538

Chapter Fourteen: Intelligence and Society

1. When will societies take a census of their ability resources?	545
2. The intelligence distribution and its effects on society	549
3. What is presently happening to our intelligence resources?	561
4. Intelligence and some major socio-political processes	570
5. Intelligence and living standards: the psycho-economic theories of ability dislocation and shift	581
6. Technical conditions and practical effects of testing programs in schools and occupations.	592

7. On the effective educational and community use of ability resources	609
8. Augmenting the springs of ability	619
Glossary	625
References	635
Author Index	671
Subject Index	681

TABLES AND FIGURES

Chapter One

None

Chapter Two

Table 2.1.	The recognition of unitary surface traits by a correlation matrix	15
Table 2.2.	Factor structure derived from experimentally given correlations	17
Fig. 2.1.	Plots showing how the variance on variables can be assigned a factor composition, by source trait coordinates	18
Table 2.3.	Correlations among diverse abilities arranged in a hierarchy.	23

Chapter Three

Table 3.1.	A tentative list of empirically based primary ability concepts	32
Fig. 3.1.	Operations in spatial and visualization abilities. . . .	40
Fig. 3.2.	Operations for inductive reasoning and word fluency primaries.	44
Fig. 3.3.	Tests used as markers for perceptual ability and personality factors	52
Fig. 3.4.	Possible systematic causes of recording primaries where they do not exist	57

Chapter Four

Fig. 4.1.	Guilford's three-dimensional box for an <i>a priori</i> classification of abilities	64
-----------	-----------------------------------------------------------------------------------------------	----

Fig. 4.2.	Some ability combinations represented in three-dimensional subspaces from the ADAC	65
Table 4.1.	The ability dimension analysis chart (ADAC): a theoretical schema	72
Fig. 4.3.	Obliteration of natural correlation in an analysis of variance experimental design.	83

Chapter Five

Fig. 5.1.	Early development of perceptual tests	88
Fig. 5.2.	Examples of five culture-fair, perceptual, relation-education subtests of proven validity for fluid intelligence	91
Table 5.1.	Two researches sampling the school age range showing the distinction of fluid and crystallized general intelligences	93
Fig. 5.3.	Diagrammatic representation of factor influences in successive strata, from a concrete prescribed example: a plasmode	95
Fig. 5.4.	Simple structure illustrated abstractly and by substantive instance of anxiety and intelligence	104
Fig. 5.5.	Dependence of definition of intelligence (in Burt-Vernon sense) on choice of variables	106
Fig. 5.6.	Resolution of indeterminacy of intelligence, by new context to fig. 5.5 in form of hyperplane variables	107
Fig. 5.7.	Plots of two age levels showing the hyperplanes determining distinct fluid and crystallized intelligence factors and their salient expressions	112
Fig. 5.8.	The "genalogical" pattern (Tree of Porphyry) of loadings required by the original hierarchical theory of abilities	118

Chapter Six

Fig. 6.1.	The relativity of hierarchies to the base of chosen variables: pyramids versus strata	123
Table 6.1.	The broad second-stratum ("capacity") factors in the ability realm.	125

Table 6.2.	A more extensive research view of loading patterns of fluid and crystallized intelligence	130
Table 6.3.	Typical correlations found among broad ability secondaries	135
Table 6.4.	Exploring ability structure at the third stratum.	136
Fig. 6.2.	The interaction of fluid ability, time, curriculum pressure, and rote learning ability.	145
Fig. 6.3.	Hypothesized causal action in the investment theory	146

Chapter Seven

Table 7.1.	Age trends and sex differences on primary mental abilities.	155
Fig. 7.1.	Normal distribution of intelligence for crystallized and fluid intelligence.	165
Fig. 7.2.	Some actual population distributions deviating from the normal model.	168
Fig. 7.3.	Growth curves and plateau onset in fluid and crystallized general intelligence	170
Fig. 7.4.	Primary abilities age changes over the school period	171
Table 7.2.	Pre-school intelligence structure: Second-stratum factors among primary abilities.	178
Fig. 7.5.	Life range curves on traditional and culture-fair intelligence tests (various mixtures of g_c and g_f)	186
Table 7.3.	Data matrices for separating endogenous, ecogenic, and epogenic components of the life span curve.	190
Fig. 7.6.	Primary ability age changes in the middle life (contrasting MLC [maintained life course] measurement results with CAS)	194
Fig. 7.7.	Age changes in a provincial "power," or ρ : visualization.	196
Fig. 7.8.	Age changes in fluid and crystallized general abilities and a composite.	197
Fig. 7.9.	Age changes in the speed and fluency-retrieval general capacities	202
Fig. 7.10.	Parallelism of age change curves in fluid intelligence and general biological efficiency (Cattell and Horn, 1966b; Robinson, 1938; Miles, 1942; and Burle et al., 1953)	204

Fig. 7.11.	Derivation of phenotypic from genotypic maturational process illustrated by investment theory of fluid into crystallized intelligence. Age: 5, 15, 25, 35, 45, 55, 65, 75; g_f values: 9, 15, 14, 13, 12, 11, 10, 9; g_c values: 6, 7, 13.0, 16.2, 17.9, 18.8, 19.3, 19.5, 19.6; g_{ct} tradition intelligence test curve follows general argument of Baltes and Schaie (1974).	206
------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	-----

Chapter Eight

Table 8.1.	Weight of certain normal human brains in grams . .	214
Fig. 8.1.	Some principal localizations of cognitive functions in the brain.	217
Fig. 8.2.	Wave forms visible in an electroencephalogram . . .	227
Fig. 8.3.	Evoked potentials as a measure of intelligence	229

Chapter Nine

Fig. 9.1.	Learning curves with and without insight.	263
Fig. 9.2.	Stages of evolution of the brain	273
Table 9.1.	Brain weights of twelve species or genuses of mammals (adult)	274
Fig. 9.3.	The main paths of brain development in the vertebrate phylum	276
Table 9.2.	A classification of test performance parameters . . .	289
Fig. 9.4.	Pattern discrimination beginning to be possible by the computer.	291

Chapter Ten

Table 10.1.	Nature and nurture variances, ratios, and correlations for intelligence (fluid and crystallized) by first MAVA experiment	320
Table 10.2.		323
Fig. 10.1.	Compositie result of many studies on resemblance	
Fig. 10.1	Compositie result of many studies on resemblance consanguinity	328
Table 10.3.	A refined assessment of nature and nurture variance contributions to intelligence	334

Fig. 10.2. Army alpha intelligence scores among draftees according to race and mean expenditures on schooling per capita, plotted by states	342
Table 10.4. Researches on heritability of primary abilities	346
Fig. 10.3. Differing racio-cultural primary ability (possibly crystallized intelligence) patterns.	361

Chapter Eleven

Table 11.1. The basic types of ability components in the triadic theory	368
Fig. 11.1. Developmental implications of the triadic theory, worked out consistently with the reticular factor model	380
Fig. 11.2. The learning of effector proficiencies in the framework of the dynamic lattice	403
Table 11.2. Summary of ability component concepts	408
Table 11.3. Numerical exemplification of the correlational and loading relationships of fluid and crystallized intelligence, time in school, interest in school, memory, and achievement	416
Fig. 11.3. Crystallized intelligence as a surface trait and as a source trait	420

Chapter Twelve

Table 12.1. Typical levels of predictions of school achievement from fluid intelligence and primary abilities.	467
Table 12.2. Correlations of primary ability agencies and fluid intelligence with broader achievements outside the classroom	468
Table 12.3. The balance of intelligence and personality in predicting a variety of life criterion performances in children	470
Table 12.4. Combined prediction of performance from abilities and personality source traits	474
Table 12.5. Dynamic source trait (erg and sentiment) strengths related (by objective measures or SMAT) to school achievement	478

Table 12.6. Relative contributions of three modalities of traits to school achievement (standardized achievement and average school grade measures)	480
Fig. 12.1. Comparison of high and low achievers on motivation factor (ergic tension) levels, measured by objective test devices.	493

Chapter Thirteen

Fig. 13.1. Personality profile common to those creative in science, art, and literature	504
Table 13.1. Behavior in the dimensions of ideational flexibility versus firmness	506
Table 13.2. The nature of the cultural pressure dimension	514
Fig. 13.2. The course of cultural pressure factor in three western cultures.	517
Fig. 13.3. Eduction of relations and correlates variously illustrated.	525
Fig. 13.4. Eduction and dissolvent thinking in hidden pictures	530

Chapter Fourteen

Table 14.1. Distribution of intelligence in occupations	553
Table 14.2. The factor of enlightened affluence as a dimension of national culture	556
Fig. 14.1. Intelligence related to number of children per family: urban and rural samples	565
Fig. 14.2. Evidence of reversal of dysgenic birth rate in upper intelligence range of population	567
Fig. 14.3. Supply and demand curves of intelligence.	585
Fig. 14.4. Effect of supply and demand on distribution of earning rates	588
Fig. 14.5. Illustrating the ability-shift theory of business cycles	591
Table 14.3. The conceptual (construct) validities of culture-fair and traditional intelligence tests	594
Table 14.4. Loadings (saturation) when general factor is defined by varied collection of intellectual ability measures	597
