PREFACE	vii
LIST OF TABLES	xiii
LIST OF FIGURES	xix

Part I: Comprehending the Stream of Behavior

Chapter

1	Introduction Julius Kuhl	3
2	Fundamentals of the Dynamics of Action John W. Atkinson and David Birch	16
3	From the Dynamics of Action to Measuring the Stream of Behavior David Birch	49
4	The Dynamic Theory of the Anxiety-Behavior Relationship: A Study on Resistance and Time Allocation Julius Kuhl and Ernst Geiger	76

Part II: Motivational Determinants of Imaginative Thought

5	Explorations Using Computer Simulation to Comprehend Thematic Apperceptive Measurement of Motivation John W. Atkinson, Kenneth Bongort, and Lawrence H. Price	97
---	---	----

Chapter

- 6 Motivational Effects of an Audience in the
Content of Imaginative Thought 125
Mio K. Reynolds

Part III: Achievement Motivation: New Directions

- 7 The Dynamic Theory of Achievement Motivation:
From Episodic to Dynamic Thinking 141
Julius Kuhl and Virginia Blankenship
- 8 The Relationship Between Consummatory Value
of Success and Achievement-Task Difficulty 159
Virginia Blankenship
- 9 Substitution in Achievement Behavior 186
Virginia Blankenship
- 10 Computer Simulation of Behavioral Expressions
of Four Personality Traits 203
David Reuman, John W. Atkinson, and
Glenn Gallop

Part IV: Thought and Action

- 11 On Conscious Thought and Emotion 237
John W. Atkinson and David Birch
- 12 Cognitive Control of Action 252
David Birch, John W. Atkinson, and
Kenneth Bongort
- 13 Motivational Determinants of Decision Time:
An Application of the Dynamics of Action 265
Julius Kuhl and John W. Atkinson
- 14 Mediating Versus Meditating Cognitions in
Human Motivation: Action Control, Inertial
Motivation, and the Alienation Effect 288
Julius Kuhl and Thomas Eisenbeiser

Chapter

15	Integrating Cognitive and Dynamic Approaches: A Prospectus for a Unified Motivational Psychology Julius Kuhl	307
	APPENDIX: Microcomputer Simulation of the Dynamics of Action: Programs in BASIC David J. Atkinson	337
	BIBLIOGRAPHY	355
	INDEX	377
	ABOUT THE CONTRIBUTORS	383

List of Tables

Table

2.1	Analogous Concepts in the Treatment of Instigation of Action and Resistance to Action	38
3.1	Segment of a Domain of Scheduled Events Generated by the Model for Events E_1 , E_2 , E_3 , and E_4 with Activation Times $a_1 = 3$, $a_2 = 7$, $a_3 = 9$, and $a_4 = 11$	54
3.2	Examples of the Relationships Among Instigating Force, F , from the Theory of the Dynamics of Action; Activation Time, a , from the Fixed Activation Time Scheduling Model; and Relative Time Spent, $t(A)$, in Activities in the Stream of Behavior Under Steady State Conditions	69-70
3.3	Relative Frequency of Activities in the Stream of Behavior as Observed in Computer Simulations of the Dynamics of Action (DOA), and as Predicted from the Fixed Activation Time Scheduling Model	71
3.4	Proportion Time Spent and Relative Frequency in the Stream of Behavior According to the Theory of the Dynamics of Action Evaluated with Respect to the Independence-from-Irrelevant-Alternatives Condition	73
4.1	Medians of Anxiety Ratings (9-Point Scale) as a Function of Time and Experimental Condition	83
4.2	Product-Moment Correlations Between Phase 1 and Phase 2 for Latency and Time-Spent Measures	86

4.3	Product-Moment Correlations Between Attractiveness Ratings and Proportion of Time Spent for Three Activities, Computed Separately for Action- and State-Oriented Subjects	87
4.4	Average Proportion of Time Spent During Phase 1 in Each of Three Activities as a Function of Type of Activity Preferred	88
5.1	Theoretically Deduced Time Spent Thinking About Achievement in First Computer Simulation of Thematic Apperception Involving Five Pictures in Balanced Latin Square Design	110
5.2	Summary of Major Parameters of Interest Allowing Comparison of Internal Consistency and Construct Validity in 25 Computer Simulations of Thematic Apperceptive Measurement of n Achievement with Pictures in Latin Square Design or Fixed Order of Presentation	113
5.3	Ten Sequences of Pictures (A to E) in Balanced Latin Square Design (Study No. 1) Also Employed in Subsequent Simulations Using This Design	115
5.4	Effect of Varying the Incentive Values of Pictures for Alternative Activities x , y , and z on Percentage of Total Time Spent in Achievement Activity, Construct Validity, and Internal Consistency	119
6.1	Number of Subjects Who Wrote One or More Stories with Dominant Themes (High) and Stories Without Dominant Themes (Low) Based on Stories Written About Three Strongly Cued Pictures	132
6.2	Number of Subjects Who Obtained High Relative n Aff and Low Relative n Aff Based on Stories Written About Three Weakly Cued Pictures Under Both Conditions	133

6.3	Mean Number of Errors per Nonassociative and Associative Pair in Trials 2-31 by Condition	135
6.4	Number of Subjects with High n Aff and Low n Aff Who Wrote Stories Containing Relevant Dominant Thematic Apperceptive Theme (Present) and Who Did Not (Absent) Under Alone Condition	137
7.1	Time Spent at Five Difficulty Levels for Success-Oriented ($M_S > M_F$) and Failure-Oriented ($M_F > M_S$) Subjects for First and Second Half of Simulated Time Period	149
8.1	Time (in Minutes) to Initiate the Achievement Task and Duration of First Performance of Achievement Task by Subjects Homogeneously High on n Achievement and Low on Test Anxiety Measures	176
8.2	Mean Predictions of Numbers of Successes Given 10 More Trials at Assigned Difficulty Level by Subjects Homogeneously High on n Achievement and Low on Test Anxiety Measures	177
8.3	Analysis of Covariance of Adjusted Mean Duration (in Minutes) of First Performance of Achievement Task by Subjects Homogeneously High on n Achievement and Low on Test Anxiety Measures as a Function of Instigating Force (Subjective Probability and Its Complement)	179
9.1	Simulation Results Modeling Phase 2: Time-Spent Measures and Time to Initiate Intermediate Task Assuming Four Possible Substitution Relationships	195
9.2	Time (in Minutes) to Initiate Intermediate Task and Total Time in Intermediate and in Originally Assigned Task	199
10.1	Incentives for Each Kind of Activity by Picture in Achievement-Cued and Affiliation-Cued Thematic Apperception Tests	206

10.2	Variables in the Simulation of Arithmetic Performance in Two Settings (Alone and Multi-incentive) for 90 Hypothetical Subjects	213
10.3	Allocation of Time of 90 Hypothetical Subjects Among Three Activities in First College Setting	215
10.4	Allocation of Time of 90 Hypothetical Subjects Among Three Activities in Second College Setting	215
10.5	Personality Traits Implicated in Determination of Simulated Behaviors of 90 Hypothetical Subjects	217
10.6	Intercorrelations Among Simulated Behavioral Expressions of Four Independent Personality Traits (Three Motives and Arithmetic Ability)	220
10.7	Correlations Between Genotypic Traits (Personality) and Phenotypic Behaviors	223
10.8	Squared Correlations from Table 10.7	225
10.9	Varimax-Rotated Factor Matrix for Three Factors	226
10.10	Varimax-Rotated Factor Matrix for Four Factors	228
11.1	Positive and Negative Affective States Are Associated with the Nature of Changes in the Magnitude of Instigating Force of the Stimulus Situation Relative to the Consummatory Value of the Activity in Progress	248
11.2	Dread (Fear and Anxiety) and Relief Are Associated with Presence or Increase and Reduction of Resistance	250
12.1	Two Paradigms for the Study of Motivation	254
13.1	Mean Decision Time as a Function of the Disposition Toward Action Versus State Orientation and Type of Instruction	285

14.1	Number of Subjects Switching from a Less-Attractive to a More-Attractive Activity in Eight Experimental Groups	302
14.2	Number of Subjects that Switched to the More-Attractive Activity and Number of Subjects that Stayed with the Less-Attractive Activity	302

List of Figures

Figure

- | | | |
|-----|--|----|
| 2.1 | Various Ways in Which a Change in Relative Strength of T_A and T_B Can Come About During an Interval of Time (t) | 18 |
| 2.2 | The Net Effect on the Strength of an Action Tendency When It Is Continuously Instigated by a Stimulus and Continuously Expressed in Activity | 21 |
| 2.3 | The Effect on Strength of an Action Tendency of Continuous, Periodic, and Spasmodic Exposure to the Instigating Force of a Stimulus When the Tendency is not Being Expressed in Activity | 22 |
| 2.4 | <i>Choice</i> : Which of Two Competing Tendencies Attains Dominance First? | 29 |
| 2.5 | The Change in Strength of Tendencies Immediately Following a Change in Activity | 35 |
| 2.6 | Vicissitudes of Action Tendencies | 37 |
| 2.7 | The Effect of Resistance to an Alternative Activity on Time to Initiate That Activity | 41 |
| 2.8 | <i>Choice with resistance</i> : The Effect of Inhibitory Force is Equivalent to That of a Weaker Initial Action Tendency | 44 |
| 2.9 | Transitory Periods of Increased Vulnerability to Interruption Produced by Introduction of I_A in Curve \bar{T}_{A1} | 46 |

and Decreased Vulnerability to Interruption by the
Withdrawal of I_A in Curve \bar{T}_{A2}

2.10	Effect of Introduction and Withdrawal of Inhibitory Force with Selective Attention	47
2.11	Inhibitory Force and Resistance Without Selective Attention	48
3.1	Hypothetical Stream of Behavior for Seven Activities Generated from the Dynamics of Action	52
3.2	Frequency of Event E_1 Specified in Terms of the Activation Times for Events E_2 , E_3 , and E_4 for the Example of Fixed Activation Time Scheduling Given in Table 3.1	57
4.1	Mean Speed as a Function of Experimental Conditions	84
4.2	Speed of Performance at Fun-Pad Game as a Function of Dominant Motive and Experimental Condition	85
4.3	Latency of Achievement-Related Behavior as a Function of Dominant Motive and State Versus Action Orientation	89
4.4	Latency of Helping-Related Activity as a Function of Dominant Motive and State Versus Action Orientation	90
5.1	An Example of a Stream of Activity (x , y , z) and the Systematic Changes in Strength of Tendencies That Produced It	102
5.2	Correspondence of Simulated and Theoretical Percentage Time Spent in Critical Activity A, Assuming Percentage Time in A Equals Ratio of F_A/c_A to $F_A/c_A + F_B/c_B + F_n/c_n$ in That Environment	107

5.3	Relationship of Construct Validity and Internal Consistency in 25 Simulations of TAT Varying Design and Parameter Values	111
5.4	Effects of Duration of Consummatory Lags and Selective Attention on Internal Consistency of Time Spent Achieving in Simulations Employing Latin Square Designs	117
5.5	Effect on Internal Consistency of Mean Range in Strength-of-Action Tendencies Immediately Prior to Exposure to Critical Picture Computed After 20 TAT Simulations	121
7.1	Flow Diagram for Dynamics of Action	144
7.2	Simulated Choice Tendencies for Five Difficulty Levels and 250 Time Units	148
7.3	Simulated Choice Tendencies for Five Difficulty Levels and 200 Time Units	150
8.1	Simulation of Easy or Difficult Game ($F = 21$) with $c = .03$, Low Consummatory Value	166
8.2	Simulation of Easy or Difficult Achievement Task ($F = 21$) with $c = .07$, High Consummatory Value	167
8.3	Simulation Modeling Results for Subjects in the Easy Condition: $F = .7$, $c = .036$	180
8.4	Simulation Modeling Results for Subjects in the Difficult Condition: $F = .7$, $c = .030$	181
9.1	Simulated Change in Risk Preference as a Result of Asymmetrical Substitution $D > I > E$	192
9.2	Simulations Used to Derive Hypotheses with the Assumption of Asymmetrical Substitution, $\gamma_{DI} >$	197

γ_{EI} , Between Easy and Intermediate Achievement Activities and Difficult and Intermediate Achievement Activities

10.1	Effect of Strength of Tendency Being Expressed in Performance on the Efficiency of Performance	211
11.1	Two Conceptions of the Dual Instigating Function of a Stimulus Showing the Relation Between Overt and Covert Activity	240
11.2	The Graphic Representation of Three Possible Relationships Between Conscious Thought and Action, Treated as Covert and Overt Activity	246
12.1	An Example of the Cognitive Control of Action Simulated from the Dynamics of Action	261
13.1	Decision Time (Abscissa) as a Function of Initial-Tendency Strength (T_{X_i} or T_{Y_i} Respectively), Instigating Force (F_X or F_Y Respectively), and Decision Criterion (T_{C_1} or T_{C_2} Respectively): Impulsive Model	272
13.2	Decision Time (Abscissa) as a Function of Intervening Mental Activities (x and y) That Instigate (While Dominant) Respective Choice Tendencies (T_X and T_Y): Reflective Model	274
13.3	Predicted Decision Time as a Function of Instigating Force and Decision Model	279
13.4	Decision Time as a Function of Ratio of Instigating Forces for Biased and Unbiased Decision Models	286
14.1	A Dynamic Model of the Assumed Alienation Effect on the Basis of the Principles of Inertial Motivation and Action Control	299

14.2	Mean Decision Times Before Deciding Whether or Not to Change Behavior in Eight Groups	303
15.1	An Outline of the Coordination Between Dynamic and Cognitive Parameters	315
15.2	Two Action Plans That Start with Steps Having a Rather High Consummatory Value ($\sigma_i = 1.5$) or a Rather Low Consummatory Value ($\sigma_i = .05$)	331
