Part I The Modelica Language	
1 INTRODUCTION	3
1.1 What is Modelica?	3
1.2 What can Modelica be used for?	6
1.3 Modeling formalisms	10
1.4 Modelica Standard Library	13
1.5 Basic vocabulary	13
1.6 Summary	15
2 DIFFERENTIAL EQUATIONS	17
2.1 Concepts	17
2.2 Differential equations	17
2.3 Physical types	21
2.4 Documenting models	24
2.5 Language fundamentals	28
2.6 Problems	36
3 BUILDING AND CONNECTING COMPONENTS	39
3.1 Concepts	39
3.2 Connectors	39
3.3 Creating connectors and components	40
3.4 Defining a block	49
3.5 Existing rotational components	56
3.6 Language fundamentals	61

3.7	Summary	65
3.8	Problems	66
4	ENABLING REUSE	69
4.1	Concepts	69
4.2	Exploiting commonality	70
4.3	Reusable building blocks	71
4.4	Allowing replaceable components	75
4.5	Other replaceable entities	79
4.6	Limiting flexibility	82
4.7	Other considerations	84
4.8	Language fundamentals	85
4.9	Problems	88
5	FUNCTIONS	91
5.1	Concepts	91
5.2	Introduction to functions	92
5.3	An interpolation function	94
5.4	Multiple return values	96
5.5	Passing records as arguments	97
5.6	Using external subroutines	100
5.7	Language fundamentals	102
5.8	Problems	110
6	USING ARRAYS	113
6.1	Concepts	113
6.2	Planetary motion: Arrays of components	113
6.3	Simple 1D heat transfer: Arrays of variables	120
6.4	Using arrays with chemical systems	132
6.5	Language fundamentals	143
6.6	Problems	152
7	HYBRID MODELS	155
7.1	Concepts	155
7.2	Modeling digital circuits	155
7.3	Bouncing ball	162
7.4	Sensor modeling	166
7.5	Language fundamentals	178
7.6	Problems	186
8	EXPLORING NONLINEAR BEHAVIOR	189
8.1	Concepts	189
8.2	An ideal diode	189
8.3	Backlash	193
8.4	Thermal properties	199

8.5	Hodgkin-Huxley nerve cell models	203
8.6	Language fundamentals	206
8.7	Problems	210
9	MISCELLANEOUS	213
9.1	Lookup rules	213
9.2	Annotations	225
Part II Effective Modelica		
10	MULTI-DOMAIN MODELING	231
10.1	Concepts	231
10.2	Conveyor system	231
10.3	Residential heating system	236
10.4	Automotive library	244
10.5	Summary	252
10.6	Problems	253
11	BLOCK DIAGRAMS VS. ACAUSAL MODELING	255
11.1	Objective	255
11.2	Block diagrams	256
11.3	Acausal approach	262
11.4	Summary	263
11.5	Problems	264
12	BUILDING LIBRARIES	265
12.1	Objective	265
12.2	Classification	265
12.3	Structure	266
12.4	Documentation	271
12.5	Maximizing reusability	272
12.6	Maximizing robustness	274
12.7	Storage of Modelica source code	276
12.8	Conclusion	278
13	INITIAL CONDITIONS	279
13.1	Objective	279
13.2	Mathematical formulation	279
13.3	Using attributes	282
13.4	Start of simulation	283
13.5	Initialization based on analysis type	284
13.6	Conclusion	286
14	EFFICIENCY	287
14.1	Objective	287

14.2	Use equations	287
14.3	Avoid unnecessary events	288
14.4	Time scales	288
14.5	Providing Jacobians for functions	289
14.6	Choosing the proper integration routine	292
14.7	Tolerances	292
14.8	Variable elimination	293
14.9	Conclusion	294
	Appendices	295
A-	History of Modelica	295
A.1	Contributors to the Modelica language	299
A.2	Contributors to the Modelica Standard Library	300
B-	Modelica Syntax	301
C-	Modelica Standard Library: Connectors	309
C.1	Electrical (Analog)	309
C.2	Block diagrams	310
C.3	Translational motion	312
C.4	Rotational motion	312
D-	Modelica Standard Library: Common Units	315
D.1	Time and space	315
D.2	Periodic phenomenon	315
D.3	Mechanics	316
D.4	Thermodynamics	317
D.5	Electricity	318
D.6	Physical chemistry	318
E-	Modelica Standard Library: Constants	321
F-	Modelica Standard Library: Math Functions	323

F.2	Inverse geometric functions	323
F.3	Hyperbolic geometric functions	323
F.4	Exponential functions	323
	Glossary	324
	References	331
	Index	337

List of Figures

1.1	A 0-100 kilometer per hour test.	6
1.2	Taking a look at what is under the hood.	7
1.3	Looking inside the engine.	8
1.4	Looking inside an individual engine cylinder.	9
1.5	Simulation results from a sample race.	10
1.6	PI Controller.	11
1.7	RLC circuit schematic.	12
2.1	A simple pendulum	18
2.2	Solution for $\theta(t)$ given $L=2$, $\theta(0) = 0.1$ and $\omega(0) = 0$	20
2.3	Linear and non-linear solutions for $\theta(t)$ given $L=2$, $\theta(0) = 2.3$ and $\omega(0) = 0$	21
2.4	An RLC circuit.	21
2.5	Voltage response of model RLC.	24
2.6	Two hydraulic tanks filled with liquid.	25
2.7	Solution with initial conditions $H1=0$ and $H2=2$	26
3.1	Another RLC circuit.	40
3.2	A “free body diagram” of a Resistor.	41
3.3	Schematic for RLC4 model in Example 3.8.	48
3.4	PI controller with plant model.	49
3.5	Control system model using components from Modelica. - Blocks.	56
3.6	A single pendulum system.	59
3.7	A system with multiple pendulums.	60
4.1	The diagram view of PIController.	72
4.2	PIController model icon.	73
4.3	PIControllerAndMotor model.	74
4.4	Side by side comparison of controllers.	79
4.5	Schematic for Example 4.10.	81
5.1	Output after simulating TestPiecewise for 10 seconds.	96

5.2	Simulation results for <code>TestComplexWave</code>	99
5.3	Simulation results for <code>TestComplexWave2</code>	100
6.1	Several bodies mutually attracted by gravitational forces. . .	114
6.2	Simulating the motion of the Earth and the Moon for approximately 1 year.	119
6.3	Heat transfer in a one-dimensional rod.	121
6.4	Schematic for <code>ConductingRod</code> model in Example 6.14. .	126
6.5	Solution for <code>HTProblem1</code> model in Example 6.15.	128
6.6	Schematic for <code>ConductingRodWithConvection</code> shown in Example 6.17.	128
6.7	Simulation results for <code>HTProblem2</code> model shown in Example 6.18.	130
6.8	Comparison of steady-state solutions to <code>HTProblem1</code> . . .	131
6.9	Visualization of the Oregonator reaction.	134
6.10	Oscillatory response from the Oregonator reaction.	143
7.1	Diagram for <code>LogicCircuit</code> model in Example 7.4.	158
7.2	Output signals from <code>LogicCircuit</code> model shown in Example 7.4.	158
7.3	Diagram for <code>LogicCircuitWithLag</code> model shown in Example 7.6.	161
7.4	Output signals from <code>LogicCircuitWithLag</code> , $c = \frac{1}{5}$. . .	161
7.5	Output signals from <code>LogicCircuitWithLag</code> , $c = \frac{1}{3}$. . .	161
7.6	Behavior of model <code>BouncingBall2</code>	164
7.7	Our sensor benchmark system.	167
7.8	Performance of low ($k=10$) and high ($k=100$) gain con- trollers with ideal sensors.	168
7.9	Comparison of <code>SampleHoldSensor</code> with ideal case. . .	170
7.10	Comparison of <code>QuantizedSensor</code> with ideal case. . . .	173
7.11	Comparison of <code>PeriodSensor</code> with ideal case.	175
7.12	Comparison of <code>CountingSensor</code> with ideal case.	178
7.13	Circuit to model inertial delay.	187
8.1	Current-voltage characteristics of an ideal diode.	190
8.2	Current-voltage characteristics of an ideal diode plotted parametrically.	191
8.3	Schematic of an AC/DC power supply.	192
8.4	Voltage response of an AC/DC power supply.	192
8.5	Force-displacement characteristics for a backlash.	193
8.6	Backlash schematic with two inertias.	196
8.7	Backlash schematic with three inertias.	196
8.8	Comparison of the two backlash models for the cases shown in Figures 8.6 and 8.7.	197
8.9	Plot of $u(T)$ from Equation (8.9).	199

8.10	Temperature distributions in <code>SolidifyingRod</code> for linear and nonlinear property models.	203
8.11	Nerve cell segment schematic.	204
8.12	Dynamic response of the nerve cell.	206
8.13	Current-voltage characteristics of an ideal Zener diode.	210
9.1	Sample package hierarchy.	215
9.2	Trace of <code>p3</code> in Example 9.4.	224
9.3	Schematic for pendulum system.	227
9.4	Dymola rendering of HTML documentation for the <code>TwoTanks</code> model shown in Example 9.6.	228
10.1	Schematic for the conveyor belt system.	232
10.2	Schematic for the electric motor.	233
10.3	Schematic for the conveyor controller.	234
10.4	Schematic for the factory.	234
10.5	Comparison of desired vs. actual factory behavior.	235
10.6	Motor voltage required.	235
10.7	Schematic for the <code>House</code> model.	236
10.8	Schematic for the <code>Furnace</code> model.	238
10.9	Schematic for the <code>MechanicalThermostat</code> model.	240
10.10	Schematic for the <code>DigitalThermostat</code> model.	241
10.11	Schematic for the <code>ThermostatSystem</code> model.	243
10.12	Indoor and Outdoor temperature.	243
10.13	Packages nested inside the <code>SimpleCar</code> package.	244
10.14	Components of the <code>Engine</code> package.	246
10.15	Looking inside an individual engine cylinder.	248
10.16	Looking inside a 4 cylinder engine.	248
10.17	A simplistic five speed transmission.	249
10.18	Contents of the <code>Chassis</code> package.	250
10.19	Creating a vehicle model.	250
10.20	Top level model for dynamometer testing.	252
11.1	Grounded planetary gear with two inertias attached.	256
11.2	Planetary gear driven by the sun gear.	258
11.3	Block diagram of planetary gear system.	260
11.4	Planetary gear with torsional mount.	262
12.1	Possible file and directory structure for the <code>Chemistry</code> package.	277
14.1	Comparison between a non-stiff (top) and stiff (bottom) system.	289
14.2	Comparison of simulation time and results for the systems in Figure 14.1.	290

List of Tables

1.1	Through and across variables from various domains.	12
5.1	Example analysis types.	105
5.2	Modelica types \leftrightarrow C types.	108
5.3	Modelica types \leftrightarrow FORTRAN77 types.	109
6.1	Built-in functions for arrays in Modelica.	153
6.2	Solar system data.	154
7.1	Discrete behavior truth table.	155

List of Examples

2.1	Model of a simple pendulum.	19
2.2	Model of a pendulum without linear assumption.	20
2.3	Model for an RLC circuit.	23
2.4	Hydraulic system of two tanks.	27
3.1	Another RLC circuit.	41
3.2	A model for an electrical resistor.	43
3.3	A model for an electrical capacitor.	44
3.4	A model for an electrical inductor.	44
3.5	A model for a step voltage.	45
3.6	A model for electrical ground.	45
3.7	Another model for our RLC circuit in Figure 3.1.	46
3.8	RLC circuit using MSL.	48
3.9	A simple control system.	50
3.10	Connector used for a scalar signal.	50
3.11	A sinusoidal signal generator.	51
3.12	A block which sums two signals.	51
3.13	An integrator block.	52
3.14	A first order transfer function.	52
3.15	A multiplier block.	53
3.16	A component based control system model for the system shown in Figure 3.4.	53
3.17	Controller and mechanism.	56
3.18	One-dimensional rotational connector.	57
3.19	A rotational pendulum model.	58
3.20	A frictionless bearing.	59
3.21	A simple pendulum system.	59
3.22	A system with multiple pendulums.	60
4.1	Defining a common base model for one port electrical components.	71
4.2	Model for Resistor using OnePort.	71
4.3	Source code for the PI controller model in Figure 4.1.	73
4.4	A PI controller controlling a motor.	74
4.5	A generic controller interface.	76
4.6	A proportional gain controller.	76
4.7	An ideal proportional-differential gain controller.	77

4.8 A system containing a controller and motor. 78

4.9 A comparison of controllers using `redeclare`. 78

4.10 An example of how to redeclare several components. 81

4.11 A simple gear model. 83

5.1 A function to find a name in an array of names. 92

5.2 Invoking the `FindName` function. 94

5.3 A piece-wise linear function. 94

5.4 Evaluation of a polynomial and its derivative. 97

5.5 Calculating the sum of a series of sine waves. 98

5.6 A Modelica wrapper function for a C subroutine. 101

5.7 A Modelica wrapper function for a FORTRAN77 subroutine. 102

6.1 Poorly designed connector definition for use in multiple body problems. 114

6.2 Better connector definition for multiple body problems (using vectors). 115

6.3 Model for a free body in three dimensional space. 115

6.4 A function to calculate gravitational force. 117

6.5 A gravitational attraction model. 117

6.6 Encapsulating the gravitational force calculation 118

6.7 Creating a binary system. 118

6.8 A system including the Earth, Sun and Moon. 119

6.9 Using arrays of variables to solve Equation (6.11). 123

6.10 Connector for heat transfer. 124

6.11 Thermal conduction. 125

6.12 Thermal capacitance. 125

6.13 Fixed temperature boundary condition. 125

6.14 A rod which conducts heat. 127

6.15 Heat transfer in a conducting rod with boundary conditions. 127

6.16 A model of thermal convection. 129

6.17 Addition of the convection effect. 129

6.18 Heat transfer problem involving conduction and convection. 130

6.19 A conducting rod using the `Thermal` library. 132

7.1 Model of an “and” gate. 157

7.2 Model of an “or” gate. 157

7.3 Model of a “not” gate. 157

7.4 Model of a circuit to test `And`, `Or` and `Not`. 159

7.5 Modeling lag in a digital signal. 160

7.6 Introducing lag into our logic response. 160

7.7 A “continuous” bouncing ball. 162

7.8 A “discrete” bouncing ball. 163

7.9 Another “discrete” bouncing ball. 165

7.10 Source code for our sensor benchmark system. 168

7.11 Sensor that samples speed measurements. 169

7.12 Measurement with quantization. 172

7.13 Interval encoding measurement. 174

7.14 An interval counting approach. 177

8.1 An ideal diode model. 191

8.2 Non-linear spring backlash model. 194

8.3 Coefficient of restitution backlash model. 195

8.4	A general thermal property model interface.	200
8.5	A specific thermal property model.	201
8.6	A non-linear thermal capacitance model.	201
8.7	A rod changing from solid to liquid.	202
9.1	Using a <code>function</code> to describe a gravity field.	221
9.2	A particle model that uses dynamic scoping.	222
9.3	Gravitational acceleration generated by two bodies.	223
9.4	Particles orbiting two bodies in interesting ways.	224
9.5	A Modelica model with annotations.	226
9.6	Using annotations for documentation	228
