

Contents

1	<i>A historical introduction and theoretical concept</i>	1
	Donnison's <i>Civilization and Disease</i>	1
	Halliday's <i>Psychosocial Medicine: A Study of the Sick Society</i>	1
	Emotion as a driving force in evolutionary biology	3
	Cannon and stress; Selye and distress	5
	Wolff's <i>Stress and Disease</i>	6
	Hinkle's studies of sociocultural changes and health	7
	Holmes–Rahe life change and illness susceptibility scale	7
	Theoretical mechanisms of psychosomatic disease	11
	Social environment as initiator of a chain of events	13
	Our format: from stimulus to pathology	17
	Summary	18
2	<i>Basic patterns of social interaction</i>	19
	The basic patterns	19
	Territory in relation to dominance and subordination	20
	Dominance and subordination in monkeys	22
	Conflict behavior in rhesus monkeys	23
	Dominance and subordination in man	24
	Depression and loss of status	26
	Male and female patterns of behavior	26
	Male–female differentiation in the kibbutz	28
	Attachment behavior in female mice	29
	Maternal attachment in primates	30
	Mother–infant attachment in man	30

Generalization of attachment during maturation	33
The wish to be held and the need for attachment	34
Human sexuality as a behavioral reward system	35
Behavior of the aged food gatherer	36
Summary	38
3 <i>Inherited behavioral patterns as social assets</i>	40
Normal behavior patterns of mice	40
A disordered rodent society	42
Normal primate behavior patterns	43
A disordered primate society	48
Normal behavior patterns of hunter-gatherers	51
A disordered primitive human society	54
Summary	56
4 <i>The critical role of early experience and the programming of behavior</i>	57
The critical role of early experience	57
Socialization in mice and early experience	58
Socialization in subhuman primates and early experience	61
Programming of behavior in man and early experience	63
Innate facial expressions and body gestures in man	64
Summary	68
5 <i>Monitoring behavioral disturbances in experimental social systems</i>	69
Concepts and reasons for monitoring	69
Basic types of behavioral monitoring	70
Techniques for producing behavioral disturbances	74
Primate experiments	75
Rodent experiments	84
Comparison of results for mice and primates	90
Summary	90
6 <i>The role of the neocortex and the limbic system in social interaction</i>	92
Introduction: man's four brain systems	92
The evolutionary origin of lateralization	94
Functional differences between the two hemispheres	96
Lateralization of emotion	100
Cerebral lateralization and sexual differentiation in man	103
The limbic system: affect and programmed behavior	103
The hippocampus and territory: the amygdala and reward	105
Patterns of thinking and susceptibility to psychosomatic disease	107
Experimental sleep disturbance and failure of communication between the limbic system and the neocortex	111
Summary	116

7	<i>Neuroendocrine responses to social interaction</i>	118
	The frontal lobes and amygdalar and hippocampal function	119
	The amygdala and Cannon's sympathetic adrenal-medullary defense pattern	120
	Peripheral effects of the sympathetic adrenal-medullary response	121
	The hippocampus and adrenocortical secretion	125
	Depression and the pituitary-adrenocortical mode	126
	Endocrine characteristics of dominant and subordinate status in animals	131
	Endocrine characteristics of Type A and Type B personalities	134
	The inverse relation between the gonadotropic hormones and the defense and alarm reactions	138
	Summary	140
8	<i>Functional and structural changes in response to psychosocial stimulation</i>	141
	Distinction between Cannon and Selyean stress	141
	Changes primarily related to the sympathetic adrenal-medullary response	142
	Changes primarily related to the pituitary adrenal-cortical response	154
	Adrenal-cortical hormones and myocardial damage	161
	Psychosocial effects and immune response mechanisms	162
	Neuroendocrine mechanisms and mammary tumor formation	163
	Summary	166
9	<i>Production of disease in animals by psychosocial stimulation</i>	167
	Effects of acute psychosocial stimulation	167
	Effects of chronic psychosocial stimulation	169
	Lack of informational feedback and pathophysiology	171
	Chronic psychosocial stimulation and blood pressure elevation in mice	172
	Psychosocial factors and arteriosclerosis in CBA mice	175
	Rate of development of pathologic changes	178
	Psychosocial stimulation and renal damage	185
	Acceleration of pathologic changes by caffeinated beverages	186
	Summary	188
10	<i>Pathophysiologic consequences of human social disturbance</i>	189
	Tough and easy cultures	190
	Cardiovascular disease in Roseto	190
	Friedman and Rosenman's Type A versus Type B behavior pattern	192
	Monastic life and coronary heart disease	196
	Contrasts between traditional Japanese and American cultures	196
	Coronary heart disease in acculturated Japanese-Americans	199
	Myocardial infarction in former medical students	200
	Bereavement and myocardial infarction	200
	Blood pressure and cultural change	201
	Psychosocial factors, salt, and hypertension	208
	Cancer of the lung and psychosocial parameters	212

Psychologic attributes of breast cancer	215
Summary	217
<i>II The prevention and treatment of detrimental effects in the psychosocial environment</i>	218
Natural defenses against stressful events	218
Individual coping behavior: conservation–withdrawal and group-oriented responses	219
Psychosocial assets and the group	219
Social support as a moderator of life stresses	221
Combat studies of group-coping mechanisms	222
Small groups and the control of psychosocial stimulation	224
Relaxation response and biofeedback in the control of hypertension	226
Physiologic mechanisms and the relaxation response	229
The relaxation response in a religious context	231
The cultural canon as a social asset	232
Loss of the cultural canon and social breakdown	233
The compensatory role of religion in a culture	234
An effective cultural canon protects against disease	236
Conclusions	240
<i>Bibliography</i>	245
<i>Glossary of sociobiologic terms</i>	265
<i>Author index</i>	269
<i>Subject index</i>	275
