

CONTENTS

PREFACE	xi
CHAPTER 1 INTRODUCTION	
<i>Objectives</i>	1
1.1 Preliminary remarks	1
1.2 Some pioneers of dynamics	2
1.3 Systems science needs a broad outlook	2
1.4 The work of Thomas Young	3
1.5 Our first control system: accommodation of vision	4
1.6 Some modern work on visual accommodation	5
1.7 James Clerk Maxwell and Watt's governor	7
1.8 Now for a little mathematics	12
1.9 A first step in governor theory: the harmonic oscillator	13
1.10 The harmonic oscillator with damping	15
1.11 Motion of the collar on the governor	23
1.12 How the collar motion affects the engine speed	23
1.13 What Maxwell found and lost	25
1.14 How a damped governor can lead to hunting	27
	vii

1.15	'And the best of all ways To lengthen our days Is to steal a few hours from the night, my dear'	28
1.16	Concluding remarks	32

CHAPTER 2 FUNDAMENTALS OF LINEAR SYSTEM THEORY

	<i>Objectives</i>	36
2.1	Introducing the linear time-invariant continuous time system	36
2.2	Linearization	39
2.3	Computation and analysis go hand in hand	43
2.4	System description in normal coordinates	43
2.5	Enter the eigenvalues	46
2.6	Enter the eigenvectors	52
2.7	Solution of the system equations via the normal form	58
2.8	Weighting functions, convolution, and stability	61
2.9	Controllability and observability	67
2.10	Laplace transforms and transfer functions	69
	2.10.1 Inversion of a proper rational transform	73
	2.10.2 Inversion of the product of a proper rational function with an input transform	76
2.11	Manipulation of transfer functions	78
	References	83
	Problems	83

CHAPTER 3 SAMPLED-DATA SYSTEMS

	<i>Objectives</i>	89
3.1	Introductory remarks	89
3.2	How to make a cheap watch run like an expensive one	91
3.3	Prelude to the theory of sampling: the amplitude and phase spectra of a signal	93
3.4	Sampling and the Nyquist–Shannon theorem	99
3.5	Elementary signal recovery: zero-order hold and first-order hold	102
3.6	The Z -transform and the basic input–output relation	106
3.7	Laplace transforms and Z -transforms	109
3.8	Poles in the z -plane and the s -plane	113
3.9	The residue method of calculating Z -transforms from Laplace transforms	115
3.10	Z -transformation representation of input–output relations in sampled-data systems	117
3.11	Stability of sampled-data systems	121
3.12	Inversion of Z -transforms	122
3.13	Concluding comments	126
	References	129
	Problems	130

CHAPTER 4 SYSTEM IDENTIFICATION

	<i>Objectives</i>	133
4.1	Introductory remarks	133
4.2	Identification in the frequency domain: the basic result	134

4.3	Bode diagrams and their use	138
4.4	The effects of time delays on Bode diagrams	146
4.5	The principle of equivalent areas	150
4.6	The concepts of auto-correlation and cross-correlation	153
4.7	Generation and properties of a pseudo-random binary sequence	156
4.8	Identification based on the step response, and other topics	160
	References	163
	Problems	164

CHAPTER 5 STABILITY THEORY FOR LINEAR SYSTEMS

	<i>Objectives</i>	167
5.1	Introductory remarks	167
5.2	Liapunov stability theory for linear continuous-time systems	168
5.3	The Routh criterion	180
5.4	The Nyquist criterion	185
5.5	Stability theory for sampled-data systems	197
	References	200
	Problems	201

CHAPTER 6 DESIGN OF LINEAR FEEDBACK SYSTEMS: TIME-DOMAIN CONSIDERATIONS

	<i>Objectives</i>	203
6.1	Introductory remarks	203
6.2	Time-domain specifications	204
6.3	Steady-state errors and the concept of type number	210
6.4	Disturbance rejection	214
6.5	Integral performance indices	216
6.6	Evaluation of a class of performance indices using the Liapunov matrix equation	219
6.7	One-, two-, and three-term controllers	223
6.8	Control of systems having appreciable time delays	228
	References	230
	Problems	231

CHAPTER 7 DESIGN OF LINEAR FEEDBACK SYSTEMS: FREQUENCY-DOMAIN CONSIDERATIONS

	<i>Objectives</i>	233
7.1	Introductory remarks	233
7.2	A few correlations between time and frequency domains	235
7.3	Error coefficients and frequency response	237
7.4	M and N circles	241
7.5	The Nichols chart	244
7.6	Some simple controllers and their frequency responses	250
7.7	Systems with more complicated feedback structure	259
7.8	Case study in linearization and stabilization: a magnetic levitation suspension system	262
7.9	Concluding comments	267
	References	267
	Problems	268

CHAPTER 8 THE ROOT LOCUS METHOD

<i>Objectives</i>	270
8.1 Introduction: basic formulation and terminology	270
8.2 The locus equations in geometrical terms	274
8.3 Some sketching rules for root locus plots	276
8.4 The analytical approach to root locus	288
8.5 Concluding comments	294
References	294
Problems	294

CHAPTER 9 FUNDAMENTALS OF THE THEORY OF NON-LINEAR SYSTEMS

<i>Objectives</i>	298
9.1 Introductory remarks	298
9.2 Phase-plane analysis for second-order systems	306
9.3 Servomechanisms with state-dependent damping	321
9.4 Liapunov stability theory	325
9.5 Two frequency-domain stability criteria for non-linear systems	332
9.6 The describing function	336
9.7 The concept of the equivalent non-linearity	342
References	346
Problems	347

CHAPTER 10 MULTIVARIABLE SYSTEM DESIGN BY MEANS OF STATE-VARIABLE FEEDBACK

<i>Objectives</i>	350
10.1 Introductory remarks	350
10.2 Eigenvalue assignment	351
10.3 Decoupling theory	356
10.4 Linear optimal control with a quadratic criterion	364
10.5 The Luenberger observer	373
References	379
Problems	380
