

CONTENTS

1 GRAPH THEORY

Four-color problem, definitions, isomorphic graphs, subgraphs	
<i>Connectivity</i>	4
Valence, complete graphs, articulation point, nonseparable graphs, Menger's theorem	
<i>Path Problems</i>	8
Minimum distance, Hamilton circuit, Euler path	
<i>Trees</i>	12
Maximal tree, forest, chord, Cayley formula	
<i>Circuits and Cut-Sets</i>	16
Basic circuit, circuit rank, basic cut-set, cut-set rank	
<i>Directed Graphs</i>	19
Positive and negative valences, directed paths, strong connectivity	
<i>Planar Graphs</i>	21
Kuratowski criterion, Euler formula, stereographic projection, P -dual graph, W -dual graph, Whitney criterion, isomorphic dual graphs, basis circuits, MacLane criterion	

2 NETWORK FUNCTIONS

<i>Classical Dynamics</i>	40
Euler formula, Lagrange equation, Hamilton's principle, Hamil- tonian function, principle of least action, generalized coordinates, Hamilton's canonical equations	
<i>Various Types of Lagrangians</i>	49
Lagrange operator, energetic and nonenergetic elements, gyroscopic terms, gyrotor, nonlinear elements	

<i>Complementary Functions</i>	56
Energy and coenergy, state functions, content and cocontent, inversion, Legendre transformation, nonlinear Lagrange formulations, Duinker theorem	
<i>Network Equations</i>	61
Maximal tree, chord, circuit rank, basic mesh, mesh current, Kirchhoff's laws, cut-set, complete set, hybrid analysis, dynamic set, hybrid dissipation function, Bryant-Stern equations, normal form, complete network, Tellegen theorem, Brayton-Moser equations	
<i>Homogeneous Multiport Elements</i>	87
Conservation laws, stationary properties, reciprocity	
<i>Rectangle Diagrams</i>	89
Dual network, nonplanar graph	

3 POLYNOMIALS AND SINUSOIDS

<i>Polynomial Evaluation</i>	95
Lill method, Segner method	
<i>Interpolation</i>	97
Weierstrass theorem, Gregory-Newton formula, numerical and graphical methods	
<i>Least-Squares Approximations</i>	103
Weighting functions, orthogonal functions, Legendre polynomials	
<i>Algebraic Approximations</i>	106
Relays, threshold, saturation, hysteresis	
<i>Harmonic Generation</i>	108
Pascal's triangle, general formulas	
<i>Harmonic Analysis</i>	112
Fourier series, Dirichlet integrals, convergence of Fourier series, graphical methods, numerical methods, Gibbs phenomenon, Fejér series	
<i>Direct Harmonic Prediction</i>	126
Graphical method, Lewis method, Chebyshev polynomials	

4 THE POWER FORMULAS

<i>Time Averages</i>	131
Definition, stationary properties in nonlinear devices	
<i>General Formulas</i>	135
Phase displacements, components in phase and in quadrature, canonical equations and their evaluation	
<i>Dissipative Devices</i>	140
Real power, reactive power, power formulas, modulation products, harmonic generation	
<i>Reactive Devices</i>	149
Power formulas, frequency multiplication and translation, modulation and demodulation, unusual applications	
<i>Hysteresis</i>	159
<i>Generalizations</i>	160
Time dependency, periodic variations, hypothetical devices, mixed networks	

5 LINEARIZATION AND STABILITY

<i>Linear System Analysis</i>	165
Complex variable theory, Green's theorem, Cauchy integral theorems, singularities, Taylor and Laurent series, residues, two-sided Laplace transform, transfer functions, stability, Wall algorithm, Nyquist criterion	
<i>Linearization</i>	186
Static and dynamic linearization, first approximation, harmonic balance, describing function	
<i>Linearized System Analysis</i>	192
Reduction to standard form, inverse describing function, stability of limit cycles, closed loop response	

6 THE PHASE PLANE

Basic equations, singular points, isoclines, trajectories	
<i>The Time Interval</i>	205

<i>Forms of Trajectories</i>	208
Trajectories of linear systems, linear transformations, Liapunov extension theorem, trajectories in nonlinear systems	
<i>Topology and Stability</i>	229
Distribution of singular points, indices of points and curves, limit cycles	
<i>Trajectories without Isoclines</i>	244
Poincaré method, Liénard construction, delta method, Pell construction and generalization	
<i>Liénard Plane</i>	250
Liénard transformation, graphical methods, time intervals, limit cycle stability	
<i>Extensions</i>	257
Time dependent parameters, forced systems, higher-order systems	

7 THE LIAPUNOV METHOD

Phase space, equilibrium points, positive definite and semidefinite functions, Liapunov function

<i>Stability Criteria</i>	264
Parameter space, perturbed and unperturbed motions, Lagrange stability, stable motion, asymptotic stability	
<i>Stability Theorems</i>	267
Liapunov theorems, Chetaev theorem, Lagrange theorem, second-order system, Liénard equation, nonlinear electric networks	
<i>Extensions</i>	275
Sylvester criterion, invariant set, limiting set, stability and asymptotic stability in the whole, difference equations, discrete Liapunov function
