<i>Preface</i>	<i>page</i>	<i>xiii</i>
1	Introduction	1
2	Real and complex Wigner matrices	6
2.1	Real Wigner matrices: traces, moments and combinatorics	6
2.1.1	The semicircle distribution, Catalan numbers and Dyck paths	7
2.1.2	Proof #1 of Wigner's Theorem 2.1.1	10
2.1.3	Proof of Lemma 2.1.6: words and graphs	11
2.1.4	Proof of Lemma 2.1.7: sentences and graphs	17
2.1.5	Some useful approximations	21
2.1.6	Maximal eigenvalues and Füredi–Komlós enumeration	23
2.1.7	Central limit theorems for moments	29
2.2	Complex Wigner matrices	35
2.3	Concentration for functionals of random matrices and logarithmic Sobolev inequalities	38
2.3.1	Smoothness properties of linear functions of the empirical measure	38
2.3.2	Concentration inequalities for independent variables satisfying logarithmic Sobolev inequalities	39
2.3.3	Concentration for Wigner-type matrices	42
2.4	Stieltjes transforms and recursions	43

2.4.1	Gaussian Wigner matrices	45
2.4.2	General Wigner matrices	47
2.5	Joint distribution of eigenvalues in the GOE and the GUE	50
2.5.1	Definition and preliminary discussion of the GOE and the GUE	51
2.5.2	Proof of the joint distribution of eigenvalues	54
2.5.3	Selberg's integral formula and proof of (2.5.4)	58
2.5.4	Joint distribution of eigenvalues: alternative formulation	65
2.5.5	Superposition and decimation relations	66
2.6	Large deviations for random matrices	70
2.6.1	Large deviations for the empirical measure	71
2.6.2	Large deviations for the top eigenvalue	81
2.7	Bibliographical notes	85
3	Hermite polynomials, spacings and limit distributions for the Gaussian ensembles	90
3.1	Summary of main results: spacing distributions in the bulk and edge of the spectrum for the Gaussian ensembles	90
3.1.1	Limit results for the GUE	90
3.1.2	Generalizations: limit formulas for the GOE and GSE	93
3.2	Hermite polynomials and the GUE	94
3.2.1	The GUE and determinantal laws	94
3.2.2	Properties of the Hermite polynomials and oscillator wave-functions	99
3.3	The semicircle law revisited	101
3.3.1	Calculation of moments of \bar{L}_N	102
3.3.2	The Harer–Zagier recursion and Ledoux's argument	103
3.4	Quick introduction to Fredholm determinants	107
3.4.1	The setting, fundamental estimates and definition of the Fredholm determinant	107
3.4.2	Definition of the Fredholm adjugant, Fredholm resolvent and a fundamental identity	110

3.5	Gap probabilities at 0 and proof of Theorem 3.1.1	114
3.5.1	The method of Laplace	115
3.5.2	Evaluation of the scaling limit: proof of Lemma 3.5.1	117
3.5.3	A complement: determinantal relations	120
3.6	Analysis of the sine-kernel	121
3.6.1	General differentiation formulas	121
3.6.2	Derivation of the differential equations: proof of Theorem 3.6.1	126
3.6.3	Reduction to Painlevé V	128
3.7	Edge-scaling: proof of Theorem 3.1.4	132
3.7.1	Vague convergence of the largest eigenvalue: proof of Theorem 3.1.4	133
3.7.2	Steepest descent: proof of Lemma 3.7.2	134
3.7.3	Properties of the Airy functions and proof of Lemma 3.7.1	139
3.8	Analysis of the Tracy–Widom distribution and proof of Theorem 3.1.5	142
3.8.1	The first standard moves of the game	144
3.8.2	The wrinkle in the carpet	144
3.8.3	Linkage to Painlevé II	146
3.9	Limiting behavior of the GOE and the GSE	148
3.9.1	Pfaffians and gap probabilities	148
3.9.2	Fredholm representation of gap probabilities	155
3.9.3	Limit calculations	160
3.9.4	Differential equations	170
3.10	Bibliographical notes	181
4	Some generalities	186
4.1	Joint distribution of eigenvalues in the classical matrix ensembles	187
4.1.1	Integration formulas for classical ensembles	187
4.1.2	Manifolds, volume measures and the coarea formula	193

4.1.3	An integration formula of Weyl type	199
4.1.4	Applications of Weyl's formula	206
4.2	Determinantal point processes	214
4.2.1	Point processes: basic definitions	215
4.2.2	Determinantal processes	220
4.2.3	Determinantal projections	222
4.2.4	The CLT for determinantal processes	227
4.2.5	Determinantal processes associated with eigenvalues	228
4.2.6	Translation invariant determinantal processes	232
4.2.7	One-dimensional translation invariant determinantal processes	237
4.2.8	Convergence issues	241
4.2.9	Examples	243
4.3	Stochastic analysis for random matrices	248
4.3.1	Dyson's Brownian motion	249
4.3.2	A dynamical version of Wigner's Theorem	262
4.3.3	Dynamical central limit theorems	273
4.3.4	Large deviation bounds	277
4.4	Concentration of measure and random matrices	281
4.4.1	Concentration inequalities for Hermitian matrices with independent entries	282
4.4.2	Concentration inequalities for matrices with dependent entries	287
4.5	Tridiagonal matrix models and the β ensembles	302
4.5.1	Tridiagonal representation of β ensembles	303
4.5.2	Scaling limits at the edge of the spectrum	306
4.6	Bibliographical notes	318
5	Free probability	322
5.1	Introduction and main results	323
5.2	Noncommutative laws and noncommutative probability spaces	325

5.2.1	Algebraic noncommutative probability spaces and laws	325
5.2.2	C^* -probability spaces and the weak*-topology	329
5.2.3	W^* -probability spaces	339
5.3	Free independence	348
5.3.1	Independence and free independence	348
5.3.2	Free independence and combinatorics	354
5.3.3	Consequence of free independence: free convolution	359
5.3.4	Free central limit theorem	368
5.3.5	Freeness for unbounded variables	369
5.4	Link with random matrices	374
5.5	Convergence of the operator norm of polynomials of independent GUE matrices	394
5.6	Bibliographical notes	410
<i>Appendices</i>		414
A	Linear algebra preliminaries	414
A.1	Identities and bounds	414
A.2	Perturbations for normal and Hermitian matrices	415
A.3	Noncommutative matrix L^p -norms	416
A.4	Brief review of resultants and discriminants	417
B	Topological preliminaries	418
B.1	Generalities	418
B.2	Topological vector spaces and weak topologies	420
B.3	Banach and Polish spaces	422
B.4	Some elements of analysis	423
C	Probability measures on Polish spaces	423
C.1	Generalities	423
C.2	Weak topology	425
D	Basic notions of large deviations	427
E	The skew field \mathbb{H} of quaternions and matrix theory over \mathbb{F}	430
E.1	Matrix terminology over \mathbb{F} and factorization theorems	431

E.2	The spectral theorem and key corollaries	433
E.3	A specialized result on projectors	434
E.4	Algebra for curvature computations	435
F	Manifolds	437
F.1	Manifolds embedded in Euclidean space	438
F.2	Proof of the coarea formula	442
F.3	Metrics, connections, curvature, Hessians, and the Laplace–Beltrami operator	445
G	Appendix on operator algebras	450
G.1	Basic definitions	450
G.2	Spectral properties	452
G.3	States and positivity	454
G.4	von Neumann algebras	455
G.5	Noncommutative functional calculus	457
H	Stochastic calculus notions	459
