1	Port-Based Modeling of Dynamic Systems	1
1.1	Introduction	1
1.1.1	Modeling of dynamic systems	1
1.1.2	History of physical systems modeling of engineering systems	2
1.1.3	Tools needed for the integrated design of controlled physical systems	5
1.1.4	Object-oriented modeling	7
1.1.5	Design phases of engineering systems	7
1.1.6	Multiple views in the design and modeling process	9
1.2	Modeling philosophy	10
1.2.1	'Every model is wrong'	10
1.2.2	'A model depends on its problem context'	11
1.2.3	Physical components versus conceptual elements	11
1.3	Ports in dynamical systems models	13
1.3.1	Bilateral bonds versus unilateral signals	13
1.3.2	Dynamic conjugation versus power conjugation	15
1.3.3	Bond graph notation	16
1.4	Computational causality	17
1.5	System versus environment: system boundary	18
1.6	Elementary behaviors and basic concepts	19
1.6.1	Positive orientation and the half-arrow	19
1.6.2	Constitutive relations of elements	20
1.6.3	Storage	21
1.6.4	Irreversible transformation	25
1.6.5	Reversible transformation	26
1.6.6	Supply & demand (sources & sinks / boundary conditions)	27
1.6.7	Distribution	28
1.6.8	Summary of elements	29
1.6.9	Modulation and bond activation	29
1.7	Causal port properties	30
1.7.1	Fixed causality	30

1.7.2	Preferred causality	31
1.7.3	Arbitrary causality	32
1.7.4	Causal constraints	32
1.7.5	Causal paths	32
1.8	Causal analysis: feedback on modeling decisions	33
1.8.1	Sequential Causality Assignment Procedure (SCAP)	33
1.8.2	Example of causal analysis	37
1.9	Hierarchical modeling	38
1.9.1	Word bond graphs	38
1.9.2	Multi-bonds	38
1.9.3	Multiport generalizations	39
1.10	Example of the use of the port concept	45
1.10.1	Problem context	45
1.10.2	Functional description of the valve	46
1.10.3	Analysis	46
1.11	Conclusion	51
1.12	Future Trends	51
2	Port-Hamiltonian Systems	53
2.1	From junction structures to Dirac structures	53
2.1.1	From 0- and 1-junctions to Dirac structures	54
2.1.2	Dirac structures	56
2.1.3	Examples of Dirac structures	58
2.2	Port-Hamiltonian systems	61
2.2.1	Geometric definition of a port-Hamiltonian system	61
2.2.2	Modulated Dirac structures and port-Hamiltonian systems on manifolds	66
2.2.3	Input-state-output port-Hamiltonian systems	69
2.2.4	Input-state-output port-Hamiltonian systems with direct feed-through	71
2.2.5	Port-Hamiltonian systems with variable topology	72
2.3	Relationships with classical Hamiltonian and Euler-Lagrange equations	74
2.3.1	From Euler-Lagrange equations to port-Hamiltonian systems	74
2.3.2	Port-Hamiltonian systems and Legendre transformations ...	77
2.4	Representations of Dirac structures and port-Hamiltonian systems ..	84
2.4.1	Representations of Dirac structures	84
2.4.2	Representations of port-Hamiltonian systems	88
2.4.3	Elimination of Lagrangian multipliers and constraints	91
2.4.4	Port-Hamiltonian systems in canonical coordinates – Casimirs and algebraic constraints	95
2.4.5	Well-posedness of port-Hamiltonian systems	97
2.5	Interconnection of port-Hamiltonian systems	99
2.5.1	Composition of Dirac structures	99
2.5.2	Regularity of interconnections	105

2.5.3	Interconnection of port-Hamiltonian systems	107
2.6	Analysis of port-Hamiltonian systems	108
2.6.1	Passivity	108
2.6.2	Casimirs of port-Hamiltonian systems	111
2.6.3	Algebraic constraints of port-Hamiltonian systems	115
2.7	Integrability of modulated Dirac structures	116
2.8	Scattering representation of Dirac structures and port-Hamiltonian systems	120
2.8.1	What is “scattering”?	120
2.8.2	Scattering representation of ports and Dirac structures	122
2.8.3	Inner product scattering representations	125
2.8.4	Interconnection in scattering representation	128
3	Port-Based Modeling in Different Domains	131
3.1	Modeling of electrical systems	131
3.1.1	Electronic power converter circuits	132
3.1.2	Electromechanical energy conversion in the port-Hamiltonian framework	135
3.1.3	Elementary electromagnet	137
3.1.4	Coupling of the boost converter and the electromagnet	140
3.1.5	Variable structure systems	141
3.2	Modeling of mechanical systems	145
3.2.1	Short introduction and motivations	145
3.2.2	Configuration and twist of a rigid body	146
3.2.3	Rigid body dynamics	150
3.2.4	Rigid mechanisms: interconnections of rigid bodies	154
3.2.5	Flexible mechanisms	157
3.3	Modeling of simple elastic systems	158
3.3.1	Introduction	158
3.3.2	Simple elasticity	159
3.3.3	The Hamiltonian and Lagrangian picture	164
3.3.4	The linearized scenario	166
3.3.5	Reduction	166
3.3.6	The Euler-Bernoulli beam	169
3.3.7	Summary	171
3.4	Port-based modelling and irreversible thermodynamics	172
3.4.1	Basic concepts	172
3.4.2	Distributed parameter systems	174
3.4.3	Lumped parameter systems	183
3.4.4	Constitutive equations	185
3.4.5	Port-based modelling examples	194

4	Infinite-Dimensional Port-Hamiltonian Systems	211
4.1	Modelling origins of boundary port-Hamiltonian systems	211
4.1.1	Conservation law and irreversible thermodynamics	212
4.1.2	Reversible physical systems of two coupled conservation laws	214
4.1.3	Dirac structures underlying dissipative physical systems	224
4.2	Stokes-Dirac structures and distributed port Hamiltonian systems	228
4.2.1	Reminder on differential forms	228
4.2.2	Conservation laws and balance equations expressed using k -forms	233
4.2.3	Systems of two conservation laws	235
4.2.4	Stokes-Dirac structures	238
4.2.5	Port Hamiltonian formulation of systems of two conservation laws with boundary energy flow	244
4.2.6	Extension to distributed port variables and scattering boundary variables	248
4.3	Extension of port-Hamiltonian systems on Stokes-Dirac structures	254
4.3.1	Timoshenko beam	255
4.3.2	Nonlinear flexible link	259
4.3.3	Ideal isentropic fluid	265
4.4	Conclusion	270
5	Control of Finite-Dimensional Port-Hamiltonian Systems	273
5.1	Introduction	273
5.2	Energy-balancing control	275
5.2.1	Dissipation obstacle	277
5.3	Control by port-interconnection	277
5.3.1	Energy control	280
5.3.2	Stabilization by Casimir generation	281
5.3.3	Port control	283
5.4	Achievable Dirac structures with dissipation	285
5.4.1	Achievable Dirac structures	285
5.4.2	Achievable Resistive structures	287
5.4.3	Achievable Dirac structures with dissipation	288
5.4.4	Achievable Casimirs and constraints	290
5.4.5	The role of energy dissipation	292
5.4.6	Casimirs and the dissipation obstacle	293
5.4.7	Casimirs for any resistive relation	294
5.4.8	Casimirs for a given resistive relation	295
5.4.9	Application to control	295
5.5	Casimirs and stabilization in finite dimensions	296
5.5.1	Specific Casimirs	296
5.5.2	Casimirs in extended state-space	298
5.6	Interconnection and damping assignment passivity based-control (IDA-PBC)	301

5.6.1	Solving the matching equation	304
5.6.2	Energy–balancing of IDA–PBC	307
5.7	Power–shaping stabilization	308
5.7.1	From port-Hamiltonian systems to the Brayton–Moser equations	309
5.7.2	Geometry of Brayton–Moser’s equation	312
5.7.3	Stabilization by power–shaping	314
5.7.4	Stabilization by Casimir generation	317
5.7.5	Remarks	318
6	Analysis and Control of Infinite-Dimensional Systems	319
6.1	Introduction	319
6.2	Stability for infinite dimensional systems	321
6.2.1	Arnold’s first stability theorem approach	321
6.2.2	La Salle’s theorem approach	322
6.3	Control by damping injection	324
6.3.1	Basic results	324
6.3.2	Control of the Timoshenko beam by damping injection	325
6.4	Control by interconnection and energy shaping	329
6.4.1	General considerations	329
6.4.2	Interconnections of Dirac structures for mixed port-Hamiltonian systems	331
6.4.3	Achievable Dirac structures for mixed port-Hamiltonian systems	335
6.4.4	Control by Casimir generation	337
6.4.5	Control by interconnection of a class of mixed port-Hamiltonian systems	340
6.5	Control by energy shaping of the Timoshenko beam	355
6.5.1	Model of the plant	355
6.5.2	Casimir functionals for the closed-loop system	357
6.5.3	Control by energy shaping of the Timoshenko beam	359
A	Model Transformations and Analysis using Bond Graphs	369
A.1	Model transformations	369
A.1.1	Conversion of an ideal physical model into a bond graph	369
A.1.2	Example: systematic conversion of a simple electromechanical system model into a bond graph representation	371
A.1.3	Conversion of causal bond graphs into block diagrams	372
A.1.4	Generation of a set of mixed algebraic and differential equations	375
A.2	Linear analysis	376
A.2.1	Introduction	376
A.2.2	Impedance analysis using bond graphs	378
A.3	Port-based modeling and simulation: a simple example	379

B	Mathematical Background	381
	B.1 Linear algebra and differential geometry	381
	B.1.1 Duality in vector spaces	381
	B.1.2 Manifolds	386
	B.1.3 Geometric structures	387
	B.1.4 Lie groups and algebras	388
	B.2 Legendre transforms and co-energy	392
	B.2.1 Homogeneous functions and Euler's theorem	392
	B.2.2 Homogeneous energy functions	393
	B.2.3 Legendre transform	393
	B.2.4 Co-energy function	394
	B.2.5 Relations for co-energy functions	394
	B.2.6 Legendre transforms in simple thermodynamics	395
	B.2.7 Legendre transforms and causality	395
	B.2.8 Constitutive relations	396
	B.2.9 Maxwell reciprocity	396
	B.2.10 Intrinsic stability	396
	B.2.11 Legendre transforms in mechanics	397
	B.2.12 Legendre transforms in electrical circuits	397
C	Nomenclature and Symbols appearing in Sect. 3.4	399
