Part I THE DETERMINISTIC MODEL 1

1 Introduction and motivation 3
- 1.1 Risk and insurance 3
- 1.2 Deterministic versus stochastic models 4
- 1.3 Finance and investments 5
- 1.4 Adequacy and equity 5
- 1.5 Reassessment 6
- 1.6 Conclusion 6

2 The basic deterministic model 7
- 2.1 Cashflows 7
- 2.2 An analogy with currencies 8
- 2.3 Discount functions 9
- 2.4 Calculating the discount function 11
- 2.5 Interest and discount rates 12
- 2.6 Constant interest 12
- 2.7 Values and actuarial equivalence 13
- 2.8 Regular pattern cashflows 17
- 2.9 Balances and reserves 19
  - 2.9.1 Basic concepts 19
  - 2.9.2 Relationship between balances and reserves 21
  - 2.9.3 Prospective versus retrospective methods 22
  - 2.9.4 Recursion formulas 23
- 2.10 Time shifting and the splitting identity 24

*2.11 Change of discount function 26
*2.12 Internal rates of return 27
*2.13 Forward prices and term structure 29
2.14 Standard notation and terminology 31
2.14.1 Standard notation for cashflows discounted with interest 31
2.14.2 New notation 32
2.15 Spreadsheet calculations 33
2.16 Notes and references 33
2.17 Exercises 33

3 The life table 37
3.1 Basic definitions 37
3.2 Probabilities 38
3.3 Constructing the life table from the values of q_x 39
3.4 Life expectancy 40
3.5 Choice of life tables 42
3.6 Standard notation and terminology 42
3.7 A sample table 43
3.8 Notes and references 43
3.9 Exercises 43

4 Life annuities 45
4.1 Introduction 45
4.2 Calculating annuity premiums 46
4.3 The interest and survivorship discount function 48
4.3.1 The basic definition 48
4.3.2 Relations between y_x for various values of x 50
4.3.3 Tontines 51
4.4 Guaranteed payments 52
4.5 Deferred annuities with annual premiums 53
4.6 Some practical considerations 54
4.6.1 Gross premiums 54
4.6.2 Gender aspects 55
4.7 Standard notation and terminology 55
4.8 Spreadsheet calculations 56
4.9 Exercises 57

5 Life insurance 60
5.1 Introduction 60
5.2 Calculating life insurance premiums 60
5.3 Types of life insurance 63
5.4 Combined insurance–annuity benefits 63
5.5 Insurances viewed as annuities 67
5.6 Summary of formulas 68
5.7 A general insurance–annuity identity 69
5.7.1 The main theorem 69
5.7.2 The endowment identity 69

5.8 Standard notation and terminology 71
5.8.1 Single premium notation 71
5.8.2 Annual premium notation 72
5.8.3 Identities 72
5.9 Spreadsheet applications 72
5.10 Exercises 73

6 Insurance and annuity reserves 76
6.1 Introduction to reserves 76
6.2 The general pattern of reserves 79
6.3 Recursion 80
6.4 Detailed analysis of an insurance or annuity contract 81
6.4.1 Gains and losses 81
6.4.2 The risk–savings decomposition 83
6.5 Interest and mortality bases for reserves 84
6.6 Nonforfeiture values 86
6.7 Policies involving a 'return of the reserve' 87
6.8 Premium difference and paid-up formulas 88
6.8.1 Premium difference formulas 88
6.8.2 Paid-up formulas 89
6.8.3 Level endowment reserves 89
*6.9 Universal life and variable annuities 89
6.9.1 Universal life 90
6.9.2 Variable annuities 93
6.10 Standard notation and terminology 94
6.11 Spreadsheet applications 95
6.12 Exercises 96

7 Fractional durations 101
7.1 Introduction 101
7.2 Cashflows discounted with interest only 102
7.3 Life annuities paid *m*thly 104
7.3.1 Uniform distribution of deaths 104
7.3.2 Present value formulas 105
7.4 Immediate annuities 106
7.5 Approximation and computation 107
*7.6 Fractional period premiums and reserves 109
7.7 Reserves at fractional durations 110
7.8 Notes and references 112
7.9 Exercises 112

8 Continuous payments 115
8.1 Introduction to continuous annuities 115
8.2 The force of discount 116
8.3 The constant interest case 117
8.4 Continuous life annuities 118
8.4.1 Basic definition 118

8.4.2 Evaluation 119
8.4.3 Life expectancy revisited 120
8.5 The force of mortality 121
8.6 Insurances payable at the moment of death 122
8.6.1 Basic definitions 122
8.6.2 Evaluation 123
8.7 Premiums and reserves 125
8.8 The general insurance–annuity identity in the continuous case 126
8.9 Differential equations for reserves 127
8.10 Some examples of exact calculation 128
8.10.1 Constant force of mortality 128
8.10.2 Demoivre's law 129
8.10.3 An example of the splitting identity 130
8.11 Standard actuarial notation and terminology 131
8.12 Notes and references 131
8.13 Exercises 132

9 Select mortality 136
9.1 Introduction 136
9.2 Select and ultimate tables 137
9.3 Changes in formulas 138
9.4 Projections in annuity tables 140
9.5 Further remarks 141
9.6 Exercises 141

10 Multiple-life contracts 143
10.1 Introduction 143
10.2 The joint-life status 143
10.3 Joint-life annuities and insurances 145
10.4 Last-survivor annuities and insurances 146
10.5 Moment of death insurances 147
10.6 The general two-life annuity contract 149
10.7 The general two-life insurance contract 150
10.8 Contingent insurances 151
10.8.1 First-death contingent insurances 151
10.8.2 Second-death contingent insurances 152
10.8.3 Moment-of-death contingent insurances 153
10.8.4 General contingent probabilities 153
10.9 Duration problems 154
10.10 Applications to annuity credit risk 157
10.11 Standard notation and terminology 158
10.12 Spreadsheet applications 159
10.13 Notes and references 159
10.14 Exercises 159

11 Multiple-decrement theory 164
11.1 Introduction 164

11.2 The basic model 164
11.2.1 The multiple-decrement table 165
11.2.2 Quantities calculated from the multiple-decrement table 166
11.3 Insurances 167
11.4 Determining the model from the forces of decrement 168
11.5 The analogy with joint-life statuses 169
11.6 A machine analogy 169
11.6.1 Method 1 170
11.6.2 Method 2 171
11.7 Associated single-decrement tables 173
11.7.1 The main methods 173
11.7.2 Forces of decrement in the associated single-decrement tables 174
11.7.3 Conditions justifying the two methods 175
11.7.4 Other approaches 178
11.8 Notes and references 179
11.9 Exercises 179

12 Expenses 182
12.1 Introduction 182
12.2 Effect on reserves 184
12.3 Realistic reserve and balance calculations 185
12.4 Notes and references 187
12.5 Exercises 187

Part II THE STOCHASTIC MODEL 189

13 Survival distributions and failure times 191
13.1 Introduction to survival distributions 191
13.2 The discrete case 192
13.3 The continuous case 193
13.3.1 The basic functions 194
13.3.2 *Properties of* μ 194
13.3.3 Modes 195
13.4 Examples 195
13.4.1 The exponential distribution 195
13.4.2 The uniform distribution 195
13.4.3 The Gompertz–Makeham distribution 196
13.5 Shifted distributions 197
13.6 The standard approximation 198
13.7 The stochastic life table 199
13.8 Life expectancy in the stochastic model 201
13.9 Stochastic interest rates 202
13.10 Notes and references 202
13.11 Exercises 203

14 The stochastic approach to insurance and annuities 205
14.1 Introduction 205
14.2 The stochastic approach to insurance benefits 206
14.2.1 The discrete case 206
14.2.2 The continuous case 206
14.2.3 Approximation 207
14.2.4 Endowment insurances 208
14.3 The stochastic approach to annuity benefits 209
14.3.1 Discrete annuities 209
14.3.2 Continuous annuities 212
*14.4 Deferred contracts 213
14.5 The stochastic approach to reserves 214
14.6 The stochastic approach to premiums 215
14.6.1 The equivalence principle 215
14.6.2 Percentile premiums 216
14.6.3 Aggregate premiums 217
14.6.4 General premium principles 220
14.7 The variance of ${}_rL$ 220
14.8 Standard notation and terminology 223
14.9 Notes and references 223
14.10 Exercises 224

15 Simplifications under level benefit contracts 228
15.1 Introduction 228
15.2 Variance calculations in the continuous case 228
15.2.1 Insurances 228
15.2.2 Annuities 229
15.2.3 Prospective losses 229
15.2.4 Using equivalence principle premiums 229
15.3 Variance calculations in the discrete case 230
15.4 Exact distributions 231
15.4.1 The distribution of $\bar{Z}$ 231
15.4.2 The distribution of $\bar{Y}$ 231
15.4.3 The distribution of L 232
15.4.4 The case where T is exponentially distributed 232
15.5 Non-level benefit examples 233
15.5.1 Term insurance 233
15.5.2 Deferred insurance 234
15.5.3 An annual premium policy 234
15.6 Exercises 235

16 The minimum failure time 238
16.1 Introduction 238
16.2 Joint distributions 238
16.3 The distribution of T 240
16.3.1 The general case 240
16.3.2 The independent case 240

16.4 The joint distribution of (T, J) 240
16.4.1 The distribution function for (T, J) 240
16.4.2 Density and survival functions for (T, J) 243
16.4.3 The distribution of J 244
16.4.4 Hazard functions for (T, J) 245
16.4.5 The independent case 245
16.4.6 Nonidentifiability 247
16.4.7 Conditions for the independence of T and J 248
16.5 Other problems 249
16.6 The common shock model 250
16.7 Copulas 252
16.8 Notes and references 255
16.9 Exercises 255

Part III RISK THEORY **259**

17 The collective risk model 261
17.1 Introduction 261
17.2 The mean and variance of S 263
17.3 Generating functions 264
17.4 Exact distribution of S 265
17.5 Choosing a frequency distribution 265
17.5.1 The binomial distribution 266
17.5.2 The Poisson distribution 267
17.5.3 The negative binomial distribution 267
17.6 Choosing a severity distribution 269
17.6.1 The normal distribution 269
17.6.2 The gamma distribution 269
17.6.3 The lognormal distribution 270
17.6.4 The Pareto distribution 271
17.7 Handling the point mass at 0 271
17.8 Counting claims of a particular type 272
17.8.1 One special class 272
17.8.2 Special classes in the Poisson case 274
17.9 The sum of two compound Poisson distributions 275
17.10 Deductibles and other modifications 275
17.10.1 The nature of a deductible 276
17.10.2 Some calculations in the discrete case 277
17.10.3 Some calculations in the continuous case 278
17.10.4 The effect on aggregate claims 280
17.10.5 Other modifications 281
17.11 A recursion formula for S 281
17.11.1 The positive-valued case 281
17.11.2 The case with claims of zero amount 285
17.12 Notes and references 286
17.13 Exercises 287

18 Risk Assessment 291
18.1 Introduction 291
18.2 Utility theory 291
18.3 Convex and concave functions: Jensen's inequality 294
18.3.1 Basic definitions 294
18.3.2 Jensen's inequality 295
18.4 A general comparison method 296
18.5 Risk measures for capital adequacy 301
18.5.1 The general notion of a risk measure 301
18.5.2 Value-at-risk 301
18.5.3 Tail-value-at-risk 302
18.5.4 Distortion risk measures 305
18.6 Notes and references 305
18.7 Exercises 306

19 An introduction to stochastic processes 308
19.1 Introduction 308
19.2 Markov chains 310
19.2.1 Definition 310
19.2.2 Examples 311
19.3 Martingales 313
19.4 Finite-state Markov chains 314
19.4.1 The transition matrix 314
19.4.2 Multi-period transitions 315
19.4.3 Distributions 315
*19.4.4 Limiting distributions 316
*19.4.5 Recurrent and transient states 317
19.4.6 The nonstationary case 320
19.5 Notes and references 321
19.6 Exercises 321

20 Poisson processes 324
20.1 Introduction 324
20.2 Definition of a Poisson process 325
20.3 Waiting times 326
*20.4 Some properties of a Poisson process 326
20.4.1 Ordering of events 326
20.4.2 Distribution of arrival times 327
20.5 Nonhomogeneous Poisson processes 328
20.6 Compound Poisson processes 329
20.7 Notes and references 329
20.8 Exercises 329

21 Ruin models 332
21.1 Introduction 332
21.2 A functional equation approach 334

21.3 The martingale approach to ruin theory 336
21.3.1 Stopping times 336
21.3.2 The optional stopping theorem and its consequences 337
21.3.3 The adjustment coefficient 341
21.3.4 The main conclusions 343
21.4 Distribution of the deficit at ruin 345
21.5 Recursion formulas 346
21.5.1 Recursive calculation of ruin probabilities 346
21.5.2 The distribution of $D(u)$ 348
21.6 The compound Poisson surplus process 350
21.6.1 The basic set-up 350
21.6.2 The probability of eventual ruin 351
21.6.3 The value of $\psi(0)$ 352
21.6.4 The distribution of $D(0)$ 352
21.6.5 The case when X is exponentially distributed 352
21.7 The maximal aggregate loss 353
21.8 Notes and references 357
21.9 Exercises 357

22 Credibility theory 361
22.1 Introduction 361
22.1.1 The nature of credibility theory 361
22.1.2 Information assessment 361
22.2 Conditional expectation and variance 365
22.2.1 Conditional expectation 365
22.2.2 Conditional variance 368
22.3 General framework for Bayesian credibility 370
22.4 Classical examples 372
22.5 Approximations 375
22.5.1 A general case 375
22.5.2 The Bühlman model 376
22.5.3 Bühlman-Straub model 377
22.6 Conditions for exactness 379
22.7 Estimation 382
22.7.1 Unbiased estimators 382
22.7.2 Calculating $\mathrm{Var}(\bar{X})$ in the credibility model 383
22.7.3 Estimation of the Bülhman parameters 384
22.7.4 Estimation in the Bülhman–Straub model 385
22.8 Notes and references 386
22.9 Exercises 387

23 Multi-state models 389
23.1 Introduction 389
23.2 The discrete-time model 390
23.2.1 Discrete-time multi-state insurances 390
23.2.2 Multi-state annuities 393

23.3 The continuous-time model 395
23.3.1 Forces of transition 395
23.3.2 Stationary continuous-time processes 399
23.3.3 Some methods for nonstationary processes 401
23.3.4 Insurance and annuity applications 402
23.3.5 Semi-Markov models 403
23.4 Notes and references 403
23.5 Exercises 403

Appendix A review of probability theory 406
A.1 Introduction 406
A.2 Sample spaces and probability measures 406
A.3 Conditioning and independence 408
A.4 Random variables 408
A.5 Distributions 409
A.6 Expectations and moments 410
A.7 Expectation in terms of the distribution function 411
A.8 The normal distribution 412
A.9 Joint distributions 413
A.10 Conditioning and independence for random variables 415
A.11 Convolution 416
A.11.1 The discrete case 416
A.11.2 The continuous case 418
A.11.3 Notation and remarks 420
A.12 Moment generating functions 420
A.13 Probability generating functions 423
A.14 Mixtures 425

Answers to exercises **427**
