Introductory Survey. By H. ELLENBERG

I. Ecology and the International Biological Program	1
1. The Biological Basis of Productivity	1
2. Research in Terrestrial Biological Communities	1
II. Structure and Functioning of Ecosystems	2
1. General Scope	2
2. Primary Producers	5
3. Secondary Producers: Consumers and Predators	5
4. Decomposers	5
5. Mineral Cycling	6
6. Water Cycling	6
7. Energy Flow	7
III. Organization of the Integrated Research	7
1. Cooperative Work	7
2. Synthesis of Results	8
IV. The Research Area and the Experimental Plots	9
1. The Solling Region	9
2. The Individual Sample Areas	12
a) Beech Forest Plots (B1, B3 and 4)	13
b) Spruce Forest Plots (F1-3)	14
c) Grassland Areas (W1 and 2).	14
d) Arable Fields (A 1 and 2)	15
References	15

Part 1: Primary Production

A. Measurement of CO₂ Gas-Exchange and Transpiration in the Beech (*Fagus silvatica* L.). By O. L. LANGE and E.-D. SCHULZE

I. Introduction	16
II. Measuring Techniques	16
1. Measurement of CO ₂ Gas-Exchange and Transpiration	16
a) Plant Chamber and Transpiration Measurement	18
b) CO ₂ Gas-Exchange	20
c) Discussion of the Gas-Exchange Measurements	20
2. Measurement of Leaf Temperature and Meteorological Data	21
a) Air Temperature	21
b) Air Humidity	21

c) Absolute Light Intensity	22
d) Leaf Temperature	22
e) Water Vapour Gradient and Total Diffusion Resistance	23
III. Analysis of the Measurements	24
References	27
B. Estimation of Photosynthetically Active Leaf Area in Forests.	
By H. HELLER	
I. Methods for Beech Leaves	29
II. Preliminary Results	30
III. Methods for Spruce Needles	31
References	31
C. Phenological Observations on Beech and Spruce as a Function of Climate. By R. SCHÖBER and G. SEIBT	
I. Methods	32
II. Phenological Phases Observed in 1967	33
III. Phenological Behaviour as a Function of Temperature and Rainfall	33
D. Structure and Timber Production of the Forest Stands. — Report on the Methods Used and Some Results. By R. SCHÖBER and G. SEIBT	
I. Introduction	37
II. Standing Crop and Yield	37
1. Selection of Sample Plots	37
2. Stand Inventory	38
3. Computation of the Results	38
4. Comparison of Yield Values with Yield Table	38
5. Results of the First Forest Inventory in Spring 1967	38
III. Structure and Quality of the Stands	40
1. Method	40
2. Result of the Survey of the Beech Stand B 1	40
3. Stem and Crown Distribution	40
a) Special Method	40
b) Stem and Crown Distribution of Plot B 1	42
IV. Timber Increment	42
1. Method of Increment Research	42
2. Stand Increment of the Larger Experimental Plots	43
References	44

E. Estimation of Biomass of Forests. By H. HELLER

I. Introduction	45
II. Leaves etc.	45
III. Stem and Branches	46
IV. Roots	47
References	47

F. Distribution of Root Tips and Tender Roots of Beech. By F. H. MEYER
and D. GÖTTSCHE

I. Methods	48
II. Results and Discussion	49
1. Number of Root Tips per 100 ml of Soil	49
2. Biomass of Finest, Fine and Small Roots	51
References	52

**G. The Primary Production of the Ground Vegetation of the Luzulo-
Fagetum.** By W. EBER

I. Introduction	53
II. Method	53
III. Some Results	54
Reference	56

**H. Chemical Composition of Plants of the Field Layer. — Preliminary
Report.** By R. BORNKAMM and W. BENNERT

I. Introduction	57
II. Plant Composition	57
1. Methods	57
2. Some Results and Discussion	57
III. Biomass and Chemical Compounds per Area	59
1. Methods	59
2. Some Results and Discussion	59
References	60

**I. Primary Production of a Meadow (*Trisetetum flavescens hercynicum*)
with Different Fertilizer Treatments. — Preliminary Report.**

By B. SPEIDEL and A. WEISS

I. Introduction	61
II. Methods	61

1. Determination of the Changes in the Composition of Species Caused by Fertilizing	61
2. Measurement of the Agriculturally Utilizable Production	61
3. Investigation of the Dynamics of Increment and Losses	61
4. Above-Ground Matter	62
5. Underground Matter	62
6. Determination of the Constituent Substances	62
7. Investigation of the Root Activity	62
8. Observation of the Root Systems	63
III. Some Results	63
1. Changes in the Species Composition Caused by Fertilizing	63
2. The Utilizable Production	63
3. The Dynamics of Increment and Losses	64
a) Above-Ground Matter	64
b) Organic Matter Below Ground	64
4. The Constituent Substances	65
5. Root Activity	65
IV. Further Investigations Proposed	66
References	67
J. Green Area Indices of Grassland Communities and Agricultural Crops under Different Fertilizing Conditions. By E. GEYGER	
I. Introduction	68
II. Methods	68
III. Some Results	69
1. Grassland Communities	69
2. Agricultural Crops	69
IV. Weight/Surface Ratio	70
V. Comparison and Discussion of the Reported Data	70
Reference	71
K. Methodological Studies to Distinguish Functional from Non-functional Roots of Grassland Plants. By CH. SATOR and D. BOMMER	
I. Introduction	72
II. Material and Methods	72
1. Partial Chemical Characterisation of Cell-Wall Substances	72
2. Quantitative Determination of the Dehydrogenase Activity of Roots at Different Stages of Growth	73
3. Labelling with Carbon-14	73
III. Some Results and Discussion	73
References	74

L. Determination of Energy Values. By M. RUNGE

I. Introduction	75
II. Methods	75
1. Preparation of the Samples	75
2. Determination of Energy Value	76
III. Some Results	77
1. Energy Values of Different Plants	77
2. Seasonal Variations	78
3. Influence of Different Fertilizer Treatment	79
IV. Discussion	79
References	80

*Part 2: Secondary Production***M. Food and Energy Turnover of Leaf-eating Insects and their Influence on Primary Production.** By W. FUNKE

I. Introduction	81
II. Food and Energy Turnover	81
III. Species Used for Productivity Studies	82
IV. Methods of Measuring Population Density	82
1. Evaluation of Number of Viable Eggs Laid	82
2. Sampling from a Unit of Soil	82
3. Sampling Animals during Emergence	82
a) Photo-Eclector of the Usual Shape and Function	83
b) The Extraordinary Significance of Photo-Eclectors	86
c) Photo-Eclectors for Larger Areas	86
d) The Significance of Arboreal Photo-Eclectors in Population and Community Studies	88
4. Sampling in the Canopy Area in Respect of Fluctuations between Canopy and Ground Levels	89
a) Census of Animals on Foliage Samples	89
b) Census of Animals in Shaking Samples	89
c) Calculation of Population Density in Old Beech Stands	91
V. Preliminary Results in the Study of Production and Energy Turnover	91
1. Production of Imagines	91
2. Cost of Maintenance in Imagines	92
VI. The Influence of Leaf-eating Insects on Primary Production	92
References	93

N. Studies in the Productivity of Lepidoptera Populations. By K. WINTER

I. Introduction	94
---------------------------	----

II. Methods	94
1. Population Dynamics	94
a) Abundance of Eggs	94
b) Abundance of Caterpillars	94
c) Abundance of Pupae	95
d) Abundance of Imagines	95
2. Food and Energy Turnover	96
a) Determination of Production	96
b) Determination of Respiration	96
c) Determination of Assimilation	97
III. Some Results	97
References	99
O. Food and Energy Turnover of Phytophagous and Predatory Arthropods. — Methods Used to Study Energy Flow. By W. FUNKE and G. WEIDEMANN	
I. Introduction	100
II. Production	100
III. Respiration	101
1. Phytophagous Insects (FUNKE)	101
a) Animals Used for Measurements	101
b) Respiratory Flasks	101
c) Experimental Conditions	101
d) Duration of Measurements	102
e) Repetition of Measurements	102
f) Determination of Respiratory Loss in Leaf Miners	103
2. Zoophagous Arthropods on the Ground Layer (WEIDEMANN)	104
a) Animals Used for the Measurements	104
b) Experimental Temperature and Humidity	104
c) Duration of Measurements	104
d) Repetition of Measurements	105
3. Calculation of Population Oxygen Consumption	105
4. Computation of Population Energy Loss Due to Respiration	105
IV. Assimilation	106
1. Phytophagous Insects (FUNKE)	106
2. Predatory Arthropods of the Ground Layer (WEIDEMANN)	107
a) Food	107
b) Determination of Assimilated Food	107
c) Determination of Food Quantity	108
d) Evaluation of Assimilation (also for Phytophagous Insects).	108
References	108

P. Food and Energy Turnover of Predatory Arthropods of the Soil Surface.

— Methods Used to Study Population Dynamics Standing Crop and Production. By G. WEIDEMANN

I. Introduction	110
II. Determination of Important Species in Relation to Productivity and Energy Flow	110
III. Life Cycle and Population Dynamics	111
1. Phenology	111
2. Life Cycle	111
3. Population Dynamics	112
a) Abundance of Eggs	112
b) Abundance of Developmental Stages (Larvae) and Adults	112
c) Abundance of Large Carabidae	112
4. Life Tables	113
IV. Standing Crop	113
V. Production	113
1. Total Production	113
a) Production from Reproduction	113
b) Production from Individual Growth	114
2. Minimum Production	114
VI. Preliminary Results	114
References	118

Q. On the Abundance of Bacteria and Other Microorganisms. By G. NIESE

I. Introduction	119
II. Methods and Material	119
1. Sampling of the Soil	119
2. Preparing the Soil Suspensions for the Plate Counts	120
3. Solid Media Used for the Plate Counts	120
a) Soil Extract Glucose Agar	120
b) Malt Extract Agar	120
c) Rose Bengal Malt Extract Agar	120
4. Liquid Media Used for Tube Counts	120
a) Nitrite- and Nitrate-forming Bacteria	120
b) N ₂ -fixing Anaerobic Spore-forming Bacteria (Clostridia)	120
III. Preliminary Results	121
References	122

R. Microbial Transformation of Organic Material in the Soil.

By J. GNITTKE, CH. KUNZE and L. STEUBING

I. Introduction	123
---------------------------	-----

II. Methods and Some Results	123
1. Cellulose	123
2. Lignin	124
3. Amino Acids	126
4. Enzymes	127
5. Tannins	127
6. Chlorophyll Content	129
References	130

Part 3: Environmental Conditions

S. The Measurement of Climatic Elements which Determine Production in Various Plant Stands. — Methods and Preliminary Results. By O. KIESE

I. The Task	132
II. The Measuring Stations	132
1. The Measuring Field on W 1	132
2. The Measuring Field on B 1	133
3. Other Measuring Fields	133
III. Recording the Data	133
IV. Type of Sensors	135
V. Disposition of the Sensors	136
VI. Methods of Determining the Components of the Heat Balance	137
1. The Sverdrup (Bowen) Method	137
2. Determination of Evapotranspiration by Brogmus' Formula	138
VII. Preliminary Results	138
References	142

T. The Characterization of the Woodland Light Climate. By W. EBER

I. Introduction	143
II. Light Measurements	143
1. Integrating Measurements	143
2. Instantaneous Measurements	144
3. Mapping the Spatial Distribution of Diffuse Light	144
III. Some Results	144
1. Instantaneous Measurements	144
2. Integrating Measurements	146
3. Maps of the Distribution of Diffuse Light	148
IV. Discussion and Conclusions	149
References	151

U. Aspects of Soil Water Behavior as Related to Beech and Spruce Stands.
— Some Results of the Water Balance Investigations. By P. BENECKE
 and R. MAYER

I. Introduction	153
II. Climate, Geology and Soil	154
III. Experimental Layout	155
IV. Soil Water Tension	156
1. Changes in Tension with Time	156
2. Comment on Statistical Methods Used	157
3. Typical Tension Profiles	158
V. Flow Rates — a First Approximation	161
References	163

Va. Methods of Investigating Micromorphology of Humus. By U. BABEL

I. Introduction	164
II. Description in the Field	164
III. Investigations by Stereomicroscope	165
IV. Technique of Investigating Ground Thin Sections	165
1. Sampling and Preparation	165
2. Microscopic Techniques	166
a) Morphometry	166
b) Chemical Techniques	166
c) Optical Techniques	166
V. Cut Thin Section Study and Debris Preparation	166
1. Sampling and Preparation	166
2. Microscopic Techniques	166
VI. Particle and Fabric Analysis	167
1. Particle Analysis	167
2. Fabric Analysis	167
VII. Application of Humus Micromorphology	167
References	168

Vb. Methods Used in Micromorphological and Micromorphometric Soil Studies. By W. L. KUBIENA and E. GEYGER

I. Introduction	169
II. Freeze-Drying Methods	169
References	170

W. Soil Chemical Differences between Beech and Spruce Sites — an Example of the Methods Used. By B. ULRICH, E. AHRENS and M. ULRICH	
I. Introduction	171
1. General Framework	171
2. Research Area	172
II. Soil Chemical Methods Used	173
1. Bioelement Stores	173
a) Carbon and Nitrogen	173
b) Phosphorus	173
c) Cations	173
d) Total Cation Exchange Capacity	174
2. Equilibrium Soil Solution and Schofield's Potentials	174
3. Exchange and Solubility Equilibria	175
III. Sampling Procedures and Statistical Treatment of Data	175
IV. Analytical Errors and Sampling Effects for Bioelement Content in Mineral Soil	178
V. Carbon and Nitrogen Stores and pH	179
VI. Phosphate Stores	180
VII. Mobilizable Cation Stores	181
VIII. Equivalent Fractions of Exchangeable Cations	182
IX. Cation Equivalent Fractions in Equilibrium Soil Solution	183
X. Schofield's Potentials in Equilibrium Soil Solution	184
XI. Gapon Coefficients	187
XII. Discussion	188
References	189
 X. Investigations of the Content and the Production of Mineral Nitrogen in Soils. By M. RUNGE	
I. Introduction	191
II. Methods	192
1. Determination of Net Mineralization	192
2. Treatment of Samples	192
3. Analysis	193
4. Determination of Water Content and Volume-Weight, or "Area-Weight"	193
5. Calculation of Nmin Content	194
III. Some Results	194
1. Nmin Content of the Soil under Field Conditions	194

a) Horizontal Distribution	194
b) Vertical Distribution	196
2. Net Mineralization	198
a) Significance of Differences between the Nmin Contents before and after 6 Weeks of Storage	198
b) Vertical Distribution	198
IV. Discussion	198
1. Methodological Consequences	198
2. Field Nmin Content	199
3. Net Mineralization	200
V. Review of Further Results	200
1. Meadow Soils	200
2. Forest Soils	201
References	202

Part 4: Range of Validity of the Results

Y. Phenological Comparisons of the Forest Research Area in the Solling with Similar Forests in Other Mountain Ranges. By F. K. HARTMANN	
I. Introduction	203
II. Methods	204
1. Interpretation of the Vegetative Phases in Spring and Early Summer	204
a) General	204
b) The Development Phases of Deciduous Trees	204
c) Conifers	204
d) Herbs and Grasses	204
2. Interpretation of the Generative Phases for All Categories of Plants	204
3. Observation of the Autumn Aspect	205
III. Phenological Comparison of Solling with Other Regions	205
IV. Comparison of Phenological Development with Photosynthetic Activity	207
References	207
