Preface	vii
1 Entropy of Elementary Information Sources	1
1.1 Uniquely decipherable and irreducible codes	1
1.2 The Huffman code	9
1.3 Entropy and conditional entropy	13
1.4 Entropy and size	21
1.5 Shannon's characterization of entropy	25
2 Stationary Information Sources	29
2.1 Language as a stochastic process	29
2.2 The ergodic theorem and the martingale convergence theorem	32
2.3 The Shannon–McMillan–Breiman theorem	37
2.4 Noiseless coding theorem for ergodic sources	45
2.5 An integral representation	49
2.6 The noiseless coding theorem	53
2.7 The Kolmogorov–Sinai entropy of a dynamical system	60
3 Communication in the Presence of Noise	69
3.1 Elementary communication channels	69
3.2 Converse of the coding theorem	78
3.3 Latin square channels	84
3.4 Sequences of channels	89
3.5 Ergodic and stationary capacities of stationary channels	95
3.6 Ergodicity of stationary channels	98
3.7 Latin square channels revisited again	100
4 Quantum Coding Theorems	105
4.1 Classical and quantum probability	105

4.2	The Dirac notation	110
4.3	Elementary quantum information sources	112
4.4	Some properties of von Neumann entropy	117
4.5	Elementary classical–quantum communication channels	131
4.6	Entropy typical projections	135
4.7	Two elementary inequalities	138
4.8	The greedy algorithm for cq -channels	140
4.9	The coding theorem for product cq -channels	144
