<i>Preface</i>	page xi
<i>Table of conversions</i>	xiii
1 Framework of seismology	
1.1 Earthquake mechanics study in seismology	1
1.2 An earthquake machine	3
1.3 Broad-band seismology in crust dynamics	7
2 Magnitude and volume of a source	
2.1 Earthquake magnitude	11
2.2 Seismic energy	14
2.3 Source volume	16
2.3.1 Dual view of an earthquake source	16
2.3.2 Geometrical aspects	17
Aftershock area	17
Surface evidence	18
2.3.3 Spectral aspects of seismic waves	19
2.3.4 Ultimate strain and strain energy	20
2.3.5 The concept of the earthquake source volume	22
2.4 Earthquake statistics	22
2.4.1 Earthquake ensemble and energy partition	23
2.4.2 Seismic geography	25
2.4.3 Energy release in earthquake sequences	25
3 Radiation pattern and focal mechanisms	
3.1 Radiation pattern	28
3.1.1 Observations	28
3.1.2 Force system at a point source	29
3.1.3 Radiation patterns	33
3.2 Fault-plane solution	37
3.2.1 Elementary considerations	37

3.2.2	Graphical techniques	38
3.2.3	Basic parameters and interpretation	42
3.2.4	Limitations of the technique	44
3.3	Single- and double-couple models	44
3.3.1	Conflicting views in focal mechanism studies (historical sketch)	44
3.3.2	S-wave and its polarization angle	45
3.3.3	The use of surface waves	48
3.4	Applications of fault-plane solutions	50
3.4.1	Fault-plane data and the Earth's tectonics	50
3.4.2	Computerized techniques	52
4	Earthquake faults	
4.1	Earthquake faults and the associated displacement fields	53
4.1.1	Fault behaviour	54
4.1.2	Fault statistics	56
4.1.3	Displacement fields associated with a fault	58
4.2	Two-dimensional fault models	58
4.2.1	Elementary considerations	58
4.2.2	Uniform-width model	60
4.2.3	Determination of fault parameters	63
4.3	The elasticity theory of dislocation	65
4.3.1	A surface of shear dislocation	66
4.3.2	The force–dislocation equivalence	68
4.3.3	Three-dimensional fault models	72
4.3.4	Displacement fields on the free surface	74
5	Moving dislocations	
5.1	Teleseismic evidence for rupture propagation	82
5.1.1	Phase comparison	82
5.1.2	Directivity function	85
5.2	Body waves from a finite moving source	88
5.2.1	A moving dislocation model	88
5.2.2	Stopping phase	89
5.2.3	Corner frequency	92
5.3	Seismic moment	95
5.3.1	The use of long-period surface waves	95
5.3.2	Implications of the seismic moment	97
	Average dislocation	97
	Energy released and stress-drop	97

5.4	Source time function	99
5.4.1	Kinematic considerations	99
	Haskell model	99
	Brune model	100
	Models in earthquake seismology	102
5.4.2	Characteristic times for the faulting process	102
5.4.3	Rise time	107
5.4.4	Tsunami earthquakes with extremely long process time	109
5.5	Synthesis of seismic effects	112
5.5.1	General considerations	112
5.5.2	Strong-motion spectra of earthquakes	113
5.5.3	Seismic displacement near a fault	115
	Simulation of fault movement	115
	The dominant contribution of the fault segment closest to near-field ground motion	123
5.5.4	Synthetic seismograms	124

6 Physics of focal processes

6.1	Concepts of a fault-origin	126
6.1.1	The elastic rebound theory	126
6.1.2	Static and dynamic aspects of a seismic origin (summary)	126
6.1.3	Scaling laws	128
6.2	Fracture of rock	133
6.2.1	Failure problems in seismology	133
6.2.2	Rupture criteria	134
	Macroscopic considerations	134
	Griffith theory and modifications	136
6.2.3	Friction and stresses in a fault	138
	Stress changes in faulting	138
	Stress-drops in large earthquakes	140
	Seismic efficiency	141
6.3	Dilatancy and stick-slip	143
6.3.1	Experimental approaches	143
6.3.2	Dilatancy models	144
	Wet model	145
	Dry model	147
6.3.3	Stick-slip	149
6.4	Physics of deep-focus earthquakes	151
6.4.1	Elementary considerations	151
6.4.2	Brittle fracture under pressure	152
	Stick-slip	152

	Dehydration	153
6.4.3	Ductile fracture under pressure	154
	Shear melting	154
	Partial melting	154
6.4.4	Phase transitions	155
7 Earthquakes and tectonics		
7.1	Seismic zone as a megafault	156
7.1.1	Behaviour of the San Andreas fault	156
	Cumulative fault offsets since geological time	157
	Continuing fault offsets	158
	Earthquakes on the fault	159
	Two contrasting types of strain release	159
	Tectonic environments	159
7.1.2	Slip rates in a megafault	160
7.1.3	Earthquakes and plate tectonics	163
	Concept of a plate	163
	Configurations of moving plates	163
	Evolution of a subduction zone	165
	Inter- and intra-plate earthquakes	167
7.2	Recurrence of earthquakes	168
7.2.1	Strain accumulation	168
	Strain and stress across a fault	168
	Strain and stress fields	172
7.2.2	Seismic cycle	174
	Evidence for seismic recurrence	174
	Aspects of a seismic cycle	174
	Chronology of recent crustal movements	178
	Active faults	180
7.2.3	Seismic gap	182
	Sequence of inter-plate earthquakes	182
	Recognition of a seismic gap	184
7.3	Anelastic aspects of crustal movements	185
7.3.1	Aseismic movements of the crust	185
7.3.2	Slow migration of earthquakes and crustal deformations	186
	Observations	186
	Models	190
	Further implications	191
8 Earthquake prediction		
8.1	The framework of earthquake prediction research	194
8.1.1	The way to earthquake prediction	194

8.1.2	Structures of earthquake prediction	194
	Statistical prediction	194
	Tectonic prediction	195
	Physical (or precise) prediction	195
	Quick alarm	195
8.2	Statistical and tectonic predictions	196
8.2.1	Regionalization	196
	Seismicity	196
	Active faults	197
8.2.2	Prediction of earthquake sequences	198
	Simple statistics	198
	Earthquake recurrence in subduction zones	198
8.2.3	Prediction of seismotectonic parameters	201
8.3	Physical prediction	202
8.3.1	Basic considerations	202
	Accumulation law of seismotectonic movements	202
	Ultimate strain	202
	Seismic gap	202
	Migration of crustal activity	204
8.3.2	Clues to precise prediction	204
	Preseismic land movements	204
	Foreshocks	207
	Geophysical precursors	207
	Precursor time	209
	Dilatancy model	210
8.4	The practice of earthquake prediction	211
8.4.1	Monitoring	211
8.4.2	Evaluation of earthquake prediction	212
	Approaches to physical prediction of earthquakes	212
	Evaluating earthquake predictions by 'scores'	212
	Merit factor of earthquake prediction	214
	Predictable earthquakes	215
8.5	Further problems	218
Appendix 1	Earthquake source parameters	220
Appendix 2	Earthquake magnitude, M , versus the associated surface faulting and deformation (empirical relations)	222
Appendix 3	WWSSN station codes and locations	223
