

Contents

Preface	vii
1 Reproductive strategies in plants	1
1.1 Seeds versus vegetative reproduction	2
1.2 The principle of allocation	5
1.3 Reproductive effort	10
1.4 Life histories and fertility schedules	12
1.5 Seed size and number	16
2 Predispersal hazards	24
2.1 Seed losses due to pollination failure	24
2.2 Seed losses due to resource deficiency	27
2.3 Seed losses due to predation	29
2.4 Seed losses due to lethal gene combinations	36
3 Dispersal	38
3.1 Dispersal curves	38
3.2 Dispersal agents	40
3.3 Wind dispersal	42
3.4 External carriage by birds, animals and man	44
3.5 Myrmecochory	47
3.6 Dispersal by frugivory	49
3.7 Long distance dispersal	53
4 Soil seed banks	57
4.1 The seed content of soils	57
4.2 Seed banks in relation to life strategies	60
4.3 Seed longevity	63
4.4 Field longevity experiments	64
4.5 Ecological significance of seed banks	67

vi *Seed Ecology*

5	Dormancy	72
5.1	Ecological significance of dormancy	72
5.2	Types of dormancy	73
5.3	Cyclic changes in dormancy	77
5.4	Influence of parental environment on seed dormancy	79
5.5	Correlative effects	83
6	Germination	87
6.1	The role of gaps in regeneration	87
6.2	Temperature fluctuations	88
6.3	Light quality and periodicity	91
6.4	Microtopography and water relations	94
6.5	The chemical environment	98
7	Seedling establishment	103
7.1	Shade, seed size and seedling growth	104
7.2	Seedling morphology in relation to shade	107
7.3	Competition and seedling survival	108
7.4	Other establishment hazards: drought, burial and predation	112
8	Regeneration and diversity	117
8.1	Coexistence	117
8.2	Gap size	118
8.3	Gap diversity	121
8.4	Timing of disturbance	124
8.5	Environmental fluctuations	125
8.6	Intraspecific spacing	126
8.7	Relative abundance	129
