<i>Preface</i>	v
1. Introduction	1
1.1 Hedging in complete markets	2
1.1.1 Black & Scholes analysis and its limitations	2
1.1.2 Complete markets	4
1.2 Hedging in incomplete markets	4
1.2.1 Sources of incompleteness	4
1.2.2 Calibration	5
1.2.3 Mean-variance hedging	6
1.2.4 Utility indifference pricing and hedging	7
1.2.5 Exotic options	8
1.2.6 Optimal martingale measures	9
1.3 Notes and further reading	9
2. Stochastic Calculus	11
2.1 Filtrations and martingales	11
2.2 Semi-martingales and stochastic integrals	14
2.3 Kunita-Watanabe decomposition	20
2.4 Change of measure	25
2.5 Stochastic exponentials	30
2.6 Notes and further reading	34
3. Arbitrage and Completeness	35
3.1 Strategies and arbitrage	35
3.2 Complete markets	39

3.3	Hidden arbitrage and local times	41
3.4	Immediate arbitrage	46
3.5	Super-hedging and the optional decomposition theorem	47
3.6	Arbitrage via a non-equivalent measure change	51
3.7	Notes and further reading	55
4.	Asset Price Models	57
4.1	Exponential Lévy processes	57
4.1.1	A Lévy process primer	57
4.1.2	Examples of Lévy processes	63
4.1.3	Construction of Lévy processes by subordination	65
4.1.4	Risk-neutral Lévy modelling	67
4.1.5	Weak representation property and measure changes	69
4.2	Stochastic volatility models	70
4.2.1	Examples	71
4.2.2	Stochastic differential equations and time change	72
4.2.3	Construction of a solution via coupling	73
4.2.4	Convexity of option prices	75
4.2.5	Market completion by trading in options	76
4.2.6	Bubbles and strict local martingales	78
4.2.7	Stochastic exponentials	82
4.3	Notes and further reading	83
5.	Static Hedging	85
5.1	Static hedging of European claims	85
5.2	Duality principle in option pricing	87
5.2.1	Dynamics of the dual process	87
5.2.2	Duality relations	89
5.3	Symmetry and self-dual processes	92
5.3.1	Definitions and general properties	92
5.3.2	Semi-static hedging of barrier options	94
5.3.3	Self-dual exponential Lévy processes	95
5.3.4	Self-dual stochastic volatility models	97
5.4	Notes and further reading	101
6.	Mean-Variance Hedging	103
6.1	Concept of mean-variance hedging	103
6.2	Valuation and hedging by the Laplace method	105

6.2.1	Bilateral Laplace transforms	105
6.2.2	Valuation and hedging using Laplace transforms	106
6.3	Valuation and hedging via integro-differential equations	115
6.3.1	Feynman-Kac formula for the value function	115
6.3.2	Computation of the optimal hedging strategy	117
6.4	Mean-variance hedging of defaultable assets	118
6.4.1	Intensity-based approach	118
6.4.2	Martingale representation	120
6.4.3	Hedging of insurance claims with longevity bonds	122
6.5	Quadratic risk-minimisation for payment streams	128
6.6	Notes and further reading	130
7.	Entropic Valuation and Hedging	133
7.1	Exponential utility indifference pricing	133
7.2	The minimal entropy martingale measure	135
7.3	Duality results	142
7.4	Properties of the utility indifference price	149
7.5	Entropic hedging	154
7.6	Notes and further reading	159
8.	Hedging Constraints	161
8.1	Framework and preliminaries	161
8.2	Dynamic utility indifference pricing	164
8.3	Martingale optimality principle	165
8.4	Utility indifference hedging and pricing using BSDEs	169
8.4.1	Backward stochastic differential equations	169
8.4.2	Maximising utility from terminal wealth under trading constraints	171
8.5	Examples in Brownian markets	176
8.5.1	Complete markets	177
8.5.2	Basis risk	180
8.6	Connection to the minimal entropy measure in the unconstrained case	184
8.7	Notes and further reading	192
9.	Optimal Martingale Measures	195
9.1	Esscher measure	195
9.1.1	Geometric case	195

9.1.2	Linear case	197
9.2	Minimal entropy martingale measure	200
9.2.1	Optimal martingale measure equation	200
9.2.2	Exponential Lévy case	204
9.2.3	Orthogonal volatility case	205
9.2.4	Continuous SV models	207
9.3	Variance-optimal martingale measure	210
9.4	q -optimal martingale measure	212
9.5	Minimal martingale measure	213
9.6	Notes and further reading	218
