CONTENTS

Preface xiii

1. Stochastic Search and Optimization: Motivation and Supporting Results 1

1.1 Introduction 1

1.1.1 General Background 1

1.1.2 Formal Problem Statement; General Types of Problems and Solutions; Global versus Local Search 3

1.1.3 Meaning of "Stochastic" in Stochastic Search and Optimization 7

1.2 Some Principles of Stochastic Search and Optimization 12

1.2.1 Some Key Points 13

1.2.2 Limits of Performance: No Free Lunch Theorems 18

1.3 Gradients, Hessians, and Their Connection to Optimization of "Smooth" Functions 20

1.3.1 Definition of Gradient and Hessian in the Context of Loss Functions 20

1.3.2 First- and Second-Order Conditions for Optimization 21

1.4 Deterministic Search and Optimization: Steepest Descent and Newton–Raphson Search 22

1.4.1 Steepest Descent Method 22

1.4.2 Newton–Raphson Method and Deterministic Convergence Rates 27

1.5 Concluding Remarks 30

Exercises 31

2. Direct Methods for Stochastic Search 34

2.1 Introduction 34

2.2 Random Search with Noise-Free Loss Measurements 36

2.2.1 Some Attributes of Direct Random Search 36

2.2.2 Three Algorithms for Random Search 37

2.2.3 Example Implementations 46

2.3 Random Search with Noisy Loss Measurements 50
2.4 Nonlinear Simplex (Nelder–Mead) Algorithm 55
2.4.1 Basic Method 55
2.4.2 Adaptation for Noisy Loss Measurements 58
2.5 Concluding Remarks 60
Exercises 61

3. **Recursive Estimation for Linear Models** 65
3.1 Formulation for Estimation with Linear Models 65
3.1.1 Linear Model 66
3.1.2 Mean-Squared and Least-Squares Estimation 68
3.2 Least-Mean-Squares and Recursive-Least-Squares for Static θ 72
3.2.1 Introduction 72
3.2.2 Basic LMS Algorithm 73
3.2.3 LMS Algorithm in Adaptive Signal Processing and Control 75
3.2.4 Basic RLS Algorithm 87
3.2.5 Connection of RLS to the Newton–Raphson Method 81
3.2.6 Extensions to Multivariate RLS and Weighted Summands in Least-Squares Criterion 82
3.3 LMS, RLS, and Kalman Filter for Time-Varying θ 83
3.3.1 Introduction 83
3.3.2 LMS 85
3.3.3 RLS 86
3.3.4 Kalman Filter 87
3.4 Case Study: Analysis of Oboe Reed Data 88
3.5 Concluding Remarks 92
Exercises 93

4. **Stochastic Approximation for Nonlinear Root-Finding** 95
4.1 Introduction 95
4.2 Potpourri of Stochastic Approximation Examples 98
4.3 Convergence of Stochastic Approximation 104
4.3.1 Background 104
4.3.2 Convergence Conditions 105
4.3.3 On the Gain Sequence and Connection to ODEs 108
4.4 Asymptotic Normality and Choice of Gain Sequence 111
4.5 Extensions to Basic Stochastic Approximation 115
4.5.1 Joint Parameter and State Evolution 115
4.5.2 Adaptive Estimation and Higher-Order Algorithms 116

4.5.3 Iterate Averaging ... 117
4.5.4 Time-Varying Functions ... 120
4.6 Concluding Remarks ... 121
Exercises ... 122

5. Stochastic Gradient Form of Stochastic Approximation ... 126
5.1 Root-Finding Stochastic Approximation as a Stochastic Gradient Method ... 126
5.1.1 Basic Principles ... 127
5.1.2 Stochastic Gradient Algorithm ... 131
5.1.3 Implementation in General Nonlinear Regression Problems ... 134
5.1.4 Connection of LMS to Stochastic Gradient SA ... 135
5.2 Neural Network Training ... 138
5.3 Discrete-Event Dynamic Systems ... 142
5.4 Image Restoration ... 144
5.5 Concluding Remarks ... 147
Exercises ... 147

6. Stochastic Approximation and the Finite-Difference Method ... 150
6.1 Introduction and Contrast of Gradient-Based and Gradient-Free Algorithms ... 150
6.2 Some Motivating Examples for Gradient-Free Stochastic Approximation ... 153
6.3 Finite-Difference Algorithm ... 157
6.4 Convergence Theory ... 158
6.4.1 Bias in Gradient Estimate ... 158
6.4.2 Convergence ... 159
6.5 Asymptotic Normality ... 162
6.6 Practical Selection of Gain Sequences ... 164
6.7 Several Finite-Difference Examples ... 166
6.8 Some Extensions and Enhancements to the Finite-Difference Algorithm ... 172
6.9 Concluding Remarks ... 174
Exercises ... 174

7. Simultaneous Perturbation Stochastic Approximation ... 176
7.1 Background ... 177
7.2 Form and Motivation for Standard SPSA Algorithm ... 178
7.2.1 Basic Algorithm ... 178
7.2.2 Relationship of Gradient Estimate to True Gradient ... 179
7.3 Basic Assumptions and Supporting Theory for Convergence ... 182
7.4 Asymptotic Normality and Efficiency Analysis ... 186

7.5 Practical Implementation 188
7.5.1 Step-by-Step Implementation 188
7.5.2 Choice of Gain Sequences 189
7.6 Numerical Examples 191
7.7 Some Extensions: Optimal Perturbation Distribution; One-Measurement Form; Global, Discrete, and Constrained Optimization 193
7.8 Adaptive SPSA 196
7.8.1 Introduction and Basic Algorithm 196
7.8.2 Implementation Aspects of Adaptive SPSA 200
7.8.3 Theory on Convergence and Efficiency of Adaptive SPSA 201
7.9 Concluding Remarks 203
7.10 Appendix: Conditions for Asymptotic Normality 204
Exercises 204

8. Annealing-Type Algorithms 208
8.1 Introduction to Simulated Annealing and Motivation from the Physics of Cooling 208
8.2 Simulated Annealing Algorithm 211
8.2.1 Basic Algorithm 211
8.2.2 Modifications for Noisy Loss Function Measurements 214
8.3 Some Examples 217
8.4 Global Optimization via Annealing Algorithms Based on Stochastic Approximation 221
8.5 Concluding Remarks 225
8.6 Appendix: Convergence Theory for Simulated Annealing Based on Stochastic Approximation 226
Exercises 228

9. Evolutionary Computation I: Genetic Algorithms 231
9.1 Introduction 231
9.2 Some Historical Perspective and Motivating Applications 235
9.2.1 Brief History 235
9.2.2 Early Motivation 236
9.3 Coding of Elements for Searching 237
9.3.1 Introduction 237
9.3.2 Standard Bit Coding 237
9.3.3 Gray Coding 240
9.3.4 Real-Number Coding 241
9.4 Standard Genetic Algorithm Operations 242
9.4.1 Selection and Elitism 242

9.4.2 Crossover 244
9.4.3 Mutation and Termination 245
9.5 Overview of Basic GA Search Approach 246
9.6 Practical Guidance and Extensions: Coefficient Values, Constraints, Noisy Fitness Evaluations, Local Search, and Parent Selection 247
9.7 Examples 250
9.8 Concluding Remarks 255
Exercises 256

10. Evolutionary Computation II: General Methods and Theory 259
10.1 Introduction 259
10.2 Overview of Evolution Strategy and Evolutionary Programming with Comparisons to Genetic Algorithms 260
10.3 Schema Theory 263
10.4 What Makes a Problem Hard? 266
10.5 Convergence Theory 268
10.6 No Free Lunch Theorems 273
10.7 Concluding Remarks 275
Exercises 276

11. Reinforcement Learning via Temporal Differences 278
11.1 Introduction 278
11.2 Delayed Reinforcement and Formulation for Temporal Difference Learning 280
11.3 Basic Temporal Difference Algorithm 283
11.4 Batch and Online Implementations of TD Learning 287
11.5 Some Examples 289
11.6 Connections to Stochastic Approximation 295
11.7 Concluding Remarks 297
Exercises 298

12. Statistical Methods for Optimization in Discrete Problems 300
12.1 Introduction to Multiple Comparisons Over a Finite Set 301
12.2 Statistical Comparisons Test Without Prior Information 306
12.3 Multiple Comparisons Against One Candidate with Known Noise Variance(s) 310
12.4 Multiple Comparisons Against One Candidate with Unknown Noise Variance(s) 319
12.5 Extensions to Bonferroni Inequality; Ranking and Selection Methods in Optimization Over a Finite Set 322

12.6 Concluding Remarks 325
Exercises 326

13. Model Selection and Statistical Information 329
13.1 Bias–Variance Tradeoff 330
13.1.1 Bias and Variance as Contributors to Model Prediction Error 330
13.1.2 Interpretation of the Bias–Variance Tradeoff 334
13.1.3 Bias–Variance Analysis for Linear Models 337
13.2 Model Selection: Cross-Validation 340
13.3 The Information Matrix: Applications and Resampling-Based Computation 349
13.3.1 Introduction 349
13.3.2 Fisher Information Matrix: Definition and Two Equivalent Forms 350
13.3.3 Two Key Properties of the Information Matrix: Connections to the Covariance Matrix of Parameter Estimates 356
13.3.4 Selected Applications 357
13.3.5 Resampling-Based Calculation of the Information Matrix 360
13.4 Concluding Remarks 363
Exercises 364

14. Simulation-Based Optimization I: Regeneration, Common Random Numbers, and Selection Methods 367
14.1 Background 367
14.1.1 Focus of Chapter and Roles of Search and Optimization in Simulation 367
14.1.2 Statement of the Optimization Problem 370
14.2 Regenerative Systems 372
14.2.1 Background and Definition of the Loss Function $L(\boldsymbol{\theta})$ 372
14.2.2 Estimators of $L(\boldsymbol{\theta})$ 375
14.2.3 Estimates Related to the Gradient of $L(\boldsymbol{\theta})$ 380
14.3 Optimization with Finite-Difference and Simultaneous Perturbation Gradient Estimators 382
14.4 Common Random Numbers 385
14.4.1 Introduction 385
14.4.2 Theory and Examples for Common Random Numbers 387
14.4.3 Partial Common Random Numbers for Finite Samples 396
14.5 Selection Methods for Optimization with Discrete-Valued $\boldsymbol{\theta}$ 398
14.6 Concluding Remarks 405
Exercises 406

15. Simulation-Based Optimization II: Stochastic Gradient and Sample Path Methods 409
15.1 Framework for Gradient Estimation 409
15.1.1 Some Issues in Gradient Estimation 409
15.1.2 Gradient Estimation and the Interchange of Derivative and Integral 412
15.2 Pure Likelihood Ratio/Score Function and Pure Infinitesimal Perturbation Analysis 417
15.3 Gradient Estimation Methods in Root-Finding Stochastic Approximation: The Hybrid LR/SF and IPA Setting 420
15.4 Sample Path Optimization 425
15.5 Concluding Remarks 432
Exercises 433

16. Markov Chain Monte Carlo 436
16.1 Background 436
16.2 Metropolis–Hastings Algorithm 440
16.3 Gibbs Sampling 445
16.4 Sketch of Theoretical Foundation for Gibbs Sampling 450
16.5 Some Examples of Gibbs Sampling 453
16.6 Applications in Bayesian Analysis 457
16.7 Concluding Remarks 461
Exercises 462

17. Optimal Design for Experimental Inputs 464
17.1 Introduction 464
17.1.1 Motivation 464
17.1.2 Finite-Sample and Asymptotic (Continuous) Designs 469
17.1.3 Precision Matrix and *D*-Optimality 471
17.2 Linear Models 473
17.2.1 Background and Connections to *D*-Optimality 473
17.2.2 Some Properties of Asymptotic Designs 477
17.2.3 Orthogonal Designs 481
17.2.4 Sketch of Algorithms for Finding Optimal Designs 485
17.3 Response Surface Methodology 486
17.4 Nonlinear Models 489
17.4.1 Introduction 489
17.4.2 Methods for Coping with Dependence on θ 492
17.5 Concluding Remarks 500
17.6 Appendix: Optimal Design in Dynamic Models 501
Exercises 502

Appendix A. Selected Results from Multivariate Analysis 505
A.1 Multivariate Calculus and Analysis 505
A.2 Some Useful Results in Matrix Theory 511
Exercises 514

Appendix B. Some Basic Tests in Statistics 515
B.1 Standard One-Sample Test 515
B.2 Some Basic Two-Sample Tests 518
B.3 Comments on Other Aspects of Statistical Testing 524
Exercises 525

Appendix C. Probability Theory and Convergence 526
C.1 Basic Properties 526
C.2 Convergence Theory 529
C.2.1 Definitions of Convergence 529
C.2.2 Examples and Counterexamples Related to Convergence 532
C.2.3 Dominated Convergence Theorem 534
C.2.4 Convergence in Distribution and Central Limit Theorem 535
Exercises 537

Appendix D. Random Number Generation 538
D.1 Background and Introduction to Linear Congruential Generators 538
D.2 Transformation of Uniform Random Numbers to Other Distributions 542
Exercises 545

Appendix E. Markov Processes 547
E.1 Background on Markov Processes 547
E.2 Discrete Markov Chains 548
Exercises 551

Answers to Selected Exercises 552
