List of figures	xi
A note on notation	xiii
Introduction The econometrics of individual behaviour	1
1.1 The microeconomic approach	1
1.2 About this book	4
1.3 Acknowledgements	5
1 The theory of rational choice	7
1.1 Choice sets, preferences and utility functions	8
1.2 The opportunity set	16
1.2.1 Classical linear budget constraints	17
1.2.2 Discrete alternatives	18
1.2.3 Convex opportunity sets with kinked frontiers	19
1.2.4 Non-convex opportunity sets	22
1.3 Direct utility and the interior optimum	23
1.4 Indirect utility and Roy's identity	24
1.5 The cost function and Shephard's lemma	26
1.6 The distance function	31
1.7 Variation in preferences	34
1.7.1 Deterministic preferences	34
1.7.2 Random preferences	36
1.7.3 Random inefficiency	39

2	Survey methods and cross-section econometrics	43
2.1	Sampling techniques	44
2.1.1	The population	44
2.1.2	Exogeneity and the statistical model	45
2.1.3	Simple random sampling	48
2.1.4	Exhaustive sampling	49
2.1.5	Interval sampling	50
2.1.6	Stratified sampling	51
2.1.7	Multistage sampling	53
2.2	The survey enquiry	55
2.3	An example: the UK Family Expenditure Survey	59
2.3.1	The sample design	60
2.3.2	The form of the enquiry	60
2.3.3	Response	61
2.3.4	Reliability of survey data	62
2.4	Estimation under exogenous sampling	65
2.4.1	Maximum likelihood	65
2.4.2	Least squares	67
2.4.3	Instrumental variables	68
2.5	Estimation under endogenous sampling	69
2.5.1	Simple truncation	71
2.5.2	Endogenous stratification	76
2.6	Non-response and extraneous sample selection	80
2.6.1	Consequences of differential response	80
2.6.2	Estimation without data on non-respondents	82
2.6.3	Estimation using data on non-respondents	84
2.6.4	Multiple truncation factors	86
2.6.5	Response in experimental surveys	87
3	Choice among discrete alternatives	92
3.1	Applications of discrete choice models	93
3.1.1	Choice between discrete quantities: indivisible goods	93
3.1.2	Discrete qualities of goods	95
3.1.3	Discrete choice as an approximation to continuous choice	97
3.1.4	Choice without markets	97
3.2	Estimation and testing	98
3.2.1	Maximum likelihood under exogenous sampling	98
3.2.2	McFadden's simulation estimator	100
3.2.3	Estimation under endogenous sampling	102
3.2.4	Goodness of fit and diagnostic testing	105
3.3	Random parameter models	107
3.4	Alternative-specific random errors	111

3.4.1	The multinomial probit model	114
3.4.2	The multinomial logit model	116
3.4.3	Generalized extreme value models	119
3.5	Tversky's elimination model	121
3.6	Hierarchical and sequential discrete choice	122
3.6.1	Static hierarchical models	123
3.6.2	Sequential models	127
3.7	Composite discrete-continuous choices	131
4	Zero expenditures and corner solutions	138
4.1	Single-equation censored regression (Tobit) models	139
4.1.1	Least-squares regression in censored samples	143
4.1.2	Maximum likelihood estimation	143
4.1.3	Two-step estimation	145
4.1.4	Extensions of the Tobit model	146
4.1.5	Tobit specification tests	151
4.2	Systems of censored regression equations	153
4.2.1	Estimation without a budget constraint	154
4.2.2	Estimation in the presence of a budget constraint	155
4.3	Corner solutions	158
4.3.1	Non-random preferences	159
4.3.2	Discrete random preference regimes: the double-hurdle model	160
4.3.3	Random preferences: Kuhn-Tucker models	162
4.3.4	Random preferences: virtual prices	164
4.4	Consumption and purchases: the P -Tobit model	173
4.4.1	A simple least-squares estimator	176
4.4.2	The constant- P model	177
4.4.3	Generalized P -Tobit models	179
4.5	Partially observed explanatory variables	181
5	Non-linear budget frontiers	187
5.1	Some examples	188
5.1.1	Non-linear pricing schemes	188
5.1.2	Non-linear interest rates	190
5.1.3	The demand for characteristics	190
5.1.4	The UK tax-social security system	193
5.2	Models with deterministic preferences	198
5.2.1	The behavioural model	198
5.2.2	The use of simple regression methods	199
5.2.3	The maximum likelihood estimator	201
5.3	Models with random preferences	205
5.3.1	The behavioural model	206

viii Contents

5.3.2	The convex case	209
5.3.3	The general case	211
5.4	More on stochastic specification	212
5.4.1	Symmetric specifications: the Wales–Woodland model	212
5.4.2	Testing the stochastic specification	214
5.4.3	Specifications based on the distance function	216
6	Sequential choice in continuous time: duration analysis	222
6.1	The hazard function	223
6.2	Applications of duration models	227
6.2.1	The retirement decision	227
6.2.2	Job search	232
6.2.3	Other applications	237
6.3	Some extensions	237
6.3.1	Time-varying explanatory variables	238
6.3.2	Random heterogeneity	238
6.3.3	Competing risks	240
6.3.4	Multiple spells and multiple states	243
6.4	Parametric estimation	245
6.4.1	Maximum likelihood with exogenous initial state	245
6.4.2	Maximum likelihood under endogenous sampling	247
6.4.3	Least-squares estimation	250
6.4.4	Specification testing	251
6.5	Semi-parametric methods	254
6.5.1	An unknown mixing distribution	254
6.5.2	An unknown baseline hazard	256
7	Barriers to choice	260
7.1	Point rationing	262
7.1.1	The effect of point rationing on demand for unrationed goods	263
7.1.2	Demand for the constrained good: fully observed rationing	265
7.1.3	Demand for the constrained good: unobserved rationing	272
7.2	Bounds on behaviour	274
7.2.1	Demand for the constrained good: fully observed rationing	274
7.2.2	Demand for the constrained good: unobserved rationing	278
7.2.3	Rationing as a lower bound	279
7.3	Discrete opportunities	282
7.3.1	Barriers to discrete choice	282
7.3.2	Discrete random opportunities	286

Appendices	291
Appendix 1 Logistic, extreme value and generalized extreme value distributions	293
A1.1 The univariate logistic distribution	293
A1.2 The type I extreme value distribution	294
A1.3 Multivariate logistic distributions	295
A1.4 Generalized extreme value distributions	297
Appendix 2 Truncated and censored distributions	301
A2.1 Simple truncation	301
A2.1.1 The truncated normal distribution	302
A2.1.2 Other truncated distributions	305
A2.2 Censored distributions	308
A2.3 Truncation with respect to an extraneous variable	309
A2.4 Multiple truncation	311
A2.5 Combined truncation and censoring	314
Appendix 3 The computation of probability integrals	317
A3.1 Orthogonal polynomials	317
A3.2 Numerical quadrature	320
A3.3 The univariate normal cumulative distribution function	322
A3.4 Multivariate normal probabilities	323
A3.4.1 The bivariate normal	324
A3.4.2 Higher-dimensional normal probabilities	325
A3.5 Partially integrated normal densities	327
