

<b>1 Genomes and the flow of biological information</b>	<b>001</b>
Introduction	001
1.1 The roots of biology	002
1.2 The genome: a working blueprint for life	006
1.3 Bringing genes to life: gene expression	010
1.4 Cellular infrastructure and gene expression	014
1.5 Expression of the genome	017
1.6 Evolution of the genome and the tree of life	021
Summary	026
<b>2 Biological molecules</b>	<b>028</b>
Introduction	028
2.1 Atoms, molecules, and chemical bonds	029
2.2 Life in aqueous solution	033
2.3 Non-covalent interactions	035
2.4 Nucleotides and nucleic acids	039
2.5 The structure of DNA	042
2.6 Chemical properties of RNA	051
2.7 RNA folding and structure	054
2.8 The RNA world and its role in the evolution of modern-day life	057
2.9 Fundamentals of protein structure	060
2.10 Protein folding	064
2.11 Protein folds	069
2.12 Sugars and carbohydrates	071
2.13 Lipids	075
2.14 Chemical modification in biological regulation	079
Summary	080
Further reading	082
<b>3 The chemical basis of life</b>	<b>083</b>
Introduction	083
3.1 Thermodynamic rules in biological systems	084
3.2 Binding equilibria and kinetics	091
3.3 Binding processes in biology	096
3.4 Enzyme catalysis	102
3.5 Enzyme kinetics	109
Summary	111
Further reading	113

<b>4</b>	<b>Chromosome structure and function</b>	<b>114</b>
	Introduction	114
4.1	Organization of chromosomes	115
4.2	The cell cycle and chromosome dynamics	117
4.3	Packaging chromosomal DNA	119
4.4	Variation in chromatin structure	126
4.5	Covalent modifications of histones	128
4.6	Nucleosome-remodeling complexes	133
4.7	DNA methylation	135
4.8	Boundary elements separate chromatin domains	139
4.9	Elements required for chromosome function	142
4.10	The centromere	143
4.11	The telomere	147
4.12	Chromosome architecture in the nucleus	150
	Summary	154
	Further reading	155
<b>5</b>	<b>The cell cycle</b>	<b>157</b>
	Introduction	157
5.1	Steps in the eukaryotic cell cycle	157
5.2	Cyclins and cyclin-dependent kinases	162
5.3	Regulation of Cdk activity	166
5.4	Cell cycle regulation by Cdks	168
5.5	Regulation of proteolysis by Cdks	170
5.6	Checkpoints: intrinsic pathways that can halt the cell cycle	176
5.7	Extrinsic regulators of cell cycle progression	180
5.8	The cell cycle and cancer	182
5.9	The bacterial cell cycle	185
	Summary	190
	Further reading	192
<b>6</b>	<b>DNA replication</b>	<b>193</b>
	Introduction	193
6.1	Overview of DNA replication	193
	DNA replication: core components	201
6.2	DNA polymerases: structure and function	201
6.3	DNA polymerases: fidelity and processivity	203
6.4	Specialized polymerases	205
6.5	DNA helicases: unwinding of the double helix	207
6.6	The sliding clamp and clamp loader	212
	DNA replication: mechanism	215
6.7	Origins and initiation of DNA replication	215
6.8	Leading and lagging strand synthesis	219
6.9	The replication fork	222

6.10	Termination of DNA replication	226
6.11	The end-replication problem and telomerase	228
6.12	Chromatin replication	232
	DNA replication: regulation	234
6.13	Regulation of initiation of replication in <i>E. coli</i>	234
6.14	Regulation of replication initiation in eukaryotes	236
	Summary	240
	Further reading	241
<b>7</b>	<b>Chromosome segregation</b>	<b>243</b>
	Introduction	243
7.1	The stages of mitosis	243
7.2	Chromosome condensation and cohesion	245
7.3	The mitotic spindle	251
7.4	Prometaphase and metaphase	257
7.5	Anaphase: an irreversible step in chromosome segregation	265
7.6	The completion of mitosis and cytokinesis	269
7.7	Meiosis: generating haploid gametes from diploid cells	271
7.8	Chromosome segregation in bacteria	280
	Summary	286
	Further reading	287
<b>8</b>	<b>Transcription</b>	<b>288</b>
	Introduction	288
8.1	Overview of transcription	288
	Transcription: core components	291
8.2	RNA polymerase core enzyme	291
	Transcription: mechanism	294
8.3	Promoter recognition in bacteria and eukaryotes	294
8.4	Initiation of transcription and transition to an elongating complex	301
8.5	Transcription elongation	309
8.6	Transcription termination	314
	Transcription: regulation	316
8.7	Principles of transcription regulation	317
8.8	DNA-binding domains in transcriptional regulators	322
8.9	Mechanisms for regulating transcription in bacteria	327
8.10	Competition between <i>ci</i> and <i>Cro</i> and the fate of bacteriophage lambda	331
8.11	Mechanisms for modulating eukaryotic transcription	337
8.12	Combinatorial regulation of eukaryotic transcription	339
8.13	Signaling cascades and regulation of transcription	342
8.14	Regulation of elongation and termination by RNA and proteins	345
8.15	Transcriptional silencing	352
	Summary	357
	Further reading	359

<b>9</b>	<b>RNA processing</b>	<b>361</b>
	Introduction	361
9.1	Overview of RNA processing	361
9.2	tRNA and rRNA processing	364
9.3	tRNA and rRNA nucleotide modifications	366
9.4	mRNA capping and polyadenylation	369
9.5	RNA splicing	372
9.6	Eukaryotic mRNA splicing by the spliceosome	377
9.7	Exon definition and alternative splicing	381
9.8	RNA editing	387
9.9	Degradation of normal RNAs	392
9.10	Degradation of foreign and defective RNAs	395
9.11	RNA-binding domains in proteins	400
	Summary	403
	Further reading	404
<b>10</b>	<b>Translation</b>	<b>406</b>
	Introduction	406
10.1	Overview of translation	406
	Translation: core components	408
10.2	Transfer RNA and the genetic code	408
10.3	Aminoacyl-tRNA synthetases	412
10.4	Structure of the ribosome	416
	Translation: mechanism	420
10.5	The translation cycle: the ribosome in action	420
10.6	Protein factors critical to the translation cycle	423
10.7	Translation initiation (mostly in bacteria)	427
10.8	Translation initiation in eukaryotes	430
10.9	Translation elongation: decoding, peptide bond formation, and translocation	434
10.10	Translation termination and reinitiation	438
	Translation: regulation	444
10.11	Recoding: programmed stop codon read-through and frameshifting	444
10.12	Antibiotics that target the ribosome	451
10.13	Global regulation of initiation in bacteria and eukaryotes	453
10.14	Regulation of initiation via the 5' UTR in bacteria and eukaryotes	456
10.15	Regulation of translation via the 3' UTR in eukaryotes	460
10.16	Viral corruption of the translational machinery	467
	Summary	470
	Further reading	471
<b>11</b>	<b>Protein modification and targeting</b>	<b>473</b>
	Introduction	473
11.1	Chaperone-assisted protein folding	474
11.2	Targeting of proteins throughout the cell	478

11.3	Post-translational cleavage of the polypeptide chain	482
11.4	Lipid modification of proteins	487
11.5	Glycosylation of proteins	490
11.6	Protein phosphorylation, acetylation, and methylation	496
11.7	Protein oxidation, nitrosylation, and nitration	504
11.8	Ubiquitination and sumoylation of proteins	506
11.9	Protein degradation	513
	Summary	516
	Further reading	517
<b>12</b>	<b>Cellular responses to DNA damage</b>	<b>519</b>
	Introduction	519
12.1	Types of DNA damage	520
12.2	Post-replication mismatch repair	523
12.3	Repair of DNA damage by direct reversal	526
12.4	Repair of DNA damage by base excision repair	527
12.5	Nucleotide excision repair of bulky lesions	528
12.6	Translesion DNA synthesis	531
12.7	The DNA damage response	533
12.8	The DNA damage response in bacteria	537
12.9	The DNA damage response in eukaryotes	539
12.10	DNA damage and cell death in mammalian cells	550
	Summary	553
	Further reading	554
<b>13</b>	<b>Repair of DNA double-strand breaks and homologous recombination</b>	<b>556</b>
	Introduction	556
13.1	An overview of DNA double-strand break repair and homologous recombination	557
13.2	Double-strand break repair by non-homologous end joining	559
13.3	Homology-directed repair of double-strand breaks	562
13.4	Generation of single-stranded DNA by helicases and nucleases	564
13.5	The mechanism of DNA strand pairing and exchange	565
13.6	Gene conversion through homology-directed repair	571
13.7	Homologous recombination	576
13.8	Repair of damaged replication forks by homology-directed repair	589
13.9	Aberrant repair and recombination and chromosome rearrangements	590
	Summary	596
	Further reading	598
<b>14</b>	<b>Mobile DNA</b>	<b>599</b>
	Introduction	599
14.1	Transposable elements: overview	599

14.2	DNA-only transposons	609
14.3	Mechanism of DNA-only cut-and-paste transposition reactions	610
14.4	Mechanism of DNA-only nick-and-paste transposition reactions	616
14.5	Cellular domestication of a DNA cut-and-paste transposase in adaptive immunity	620
14.6	Retrotransposons	624
14.7	LTR retrotransposons	625
14.8	Non-LTR retrotransposons	630
14.9	Control of transposition	638
14.10	Conservative site-specific recombination: overview	645
14.11	CSSR conversion of DNA dimers to monomers: single-protein systems	649
14.12	CSSR conversion of DNA dimers to monomers: systems regulated by accessory proteins	653
14.13	CSSR systems that control gene expression	659
	Summary	664
	Further reading	665
<b>15</b>	<b>Genomics and genetic variation</b>	<b>668</b>
	Introduction	668
15.1	Genome sequences and sequencing projects	669
15.2	Finding functions in a genome	672
15.3	Evolutionary forces	679
15.4	The evolving genome	681
15.5	Duplication and divergence of gene function	686
15.6	Sequence comparisons	690
15.7	Phenotypic variation	694
15.8	Exploring evolution through genomics: examples from mammalian genomes	701
15.9	Human genetic diseases	706
	Summary	710
	Further reading	712
<b>16</b>	<b>Tools and techniques in molecular biology</b>	<b>714</b>
	Introduction	714
16.1	Model organisms	715
16.2	Cultured cells and viruses	723
16.3	Cloning and amplification of DNA and RNA sequences	727
16.4	Genome manipulation	734
16.5	Detection of biological molecules	742
16.6	Separation and isolation of biological molecules	747
16.7	Identification of biological molecules	755
16.8	Detection of specific DNA sequences	760
16.9	Detection of specific RNA molecules	765
16.10	Detection of specific proteins	769
16.11	Detection of interactions between molecules	772

16.12	Imaging cells and molecules	778
16.13	Molecular structure determination	784
16.14	Obtaining and analyzing a complete genome sequence	788
16.15	Mapping human disease genes	797
	Summary	804
	Online resources for genomics and model organisms	806
	Glossary	807
	Index	827
